

Back to the Heterotic String

Bert Schellekens

NIKHEF Jaarvergadering, 17-12-2010

Matter coupled to string gravity

Must be made of strings.

Two options: closed or open

- ✦ Closed Strings:

“Heterotic String”

- ✦ Open Strings:

“Orientifolds”

Non-perturbative: M-theory, F-theory, ...

Co-authors

What can we expect to learn
about the Standard Model?

“The hope is that the constraints imposed on such theories solely by the need for mathematical consistency are so strong that they essentially determine a single possible theory uniquely, and that by working out the consequences of the theory in detail one might eventually be able to show that there must be particles with precisely the masses, interactions, and so on, of the known elementary particles: in other words, that the world we live in is the only possible one.”

“The hope is that the constraints imposed on such theories solely by the need for mathematical consistency are so strong that they essentially determine a single possible theory uniquely, and that by working out the consequences of the theory in detail one might eventually be able to show that there must be particles with precisely the masses, interactions, and so on, of the known elementary particles: in other words, that the world we live in is the only possible one.”

From “The Problems of Physics” by Antony Legget (1987)

<http://www.ru.nl/thef/research/research/>

The research programme aims at describing and elucidating the present and future experimental baryonic data. This involves partial-wave analysis of nucleon-(anti)nucleon scattering data and the construction of nucleon-nucleon, nucleon-hyperon and hyperon-hyperon potentials, using theoretical concepts such as chiral symmetry and effective Lagrangians. A spin-off of this programme is the study of nuclear and hyperonic matter in the context of neutron stars.

- **The landscape of string vacua**

Staff involved: [Bert Schellekens](#) (creator of the landscape).

String theory is a model of fundamental physics whose building blocks are one-dimensional extended objects called strings, rather than the zero-dimensional point-particles that form the basis for the Standard Model of particle physics. The goal of the research is to find among all the possible string vacua the ones that incorporate the known laws of physics. The idea of the landscape of string vacua is based on the anthropic principle, which states that fundamental

So what can we expect to learn
about the Standard Model?

Distributions = Naturalness

- ✦ Gauge Hierarchy
- ✦ Fermion mass hierarchies
- ✦ Neutrino masses
- ✦ Suppression of proton decay
- ✦

Standard Model From Orientifolds

THE MADRID MODEL*

(* *Ibanez, Marchesano, Rabadan (2000)*)

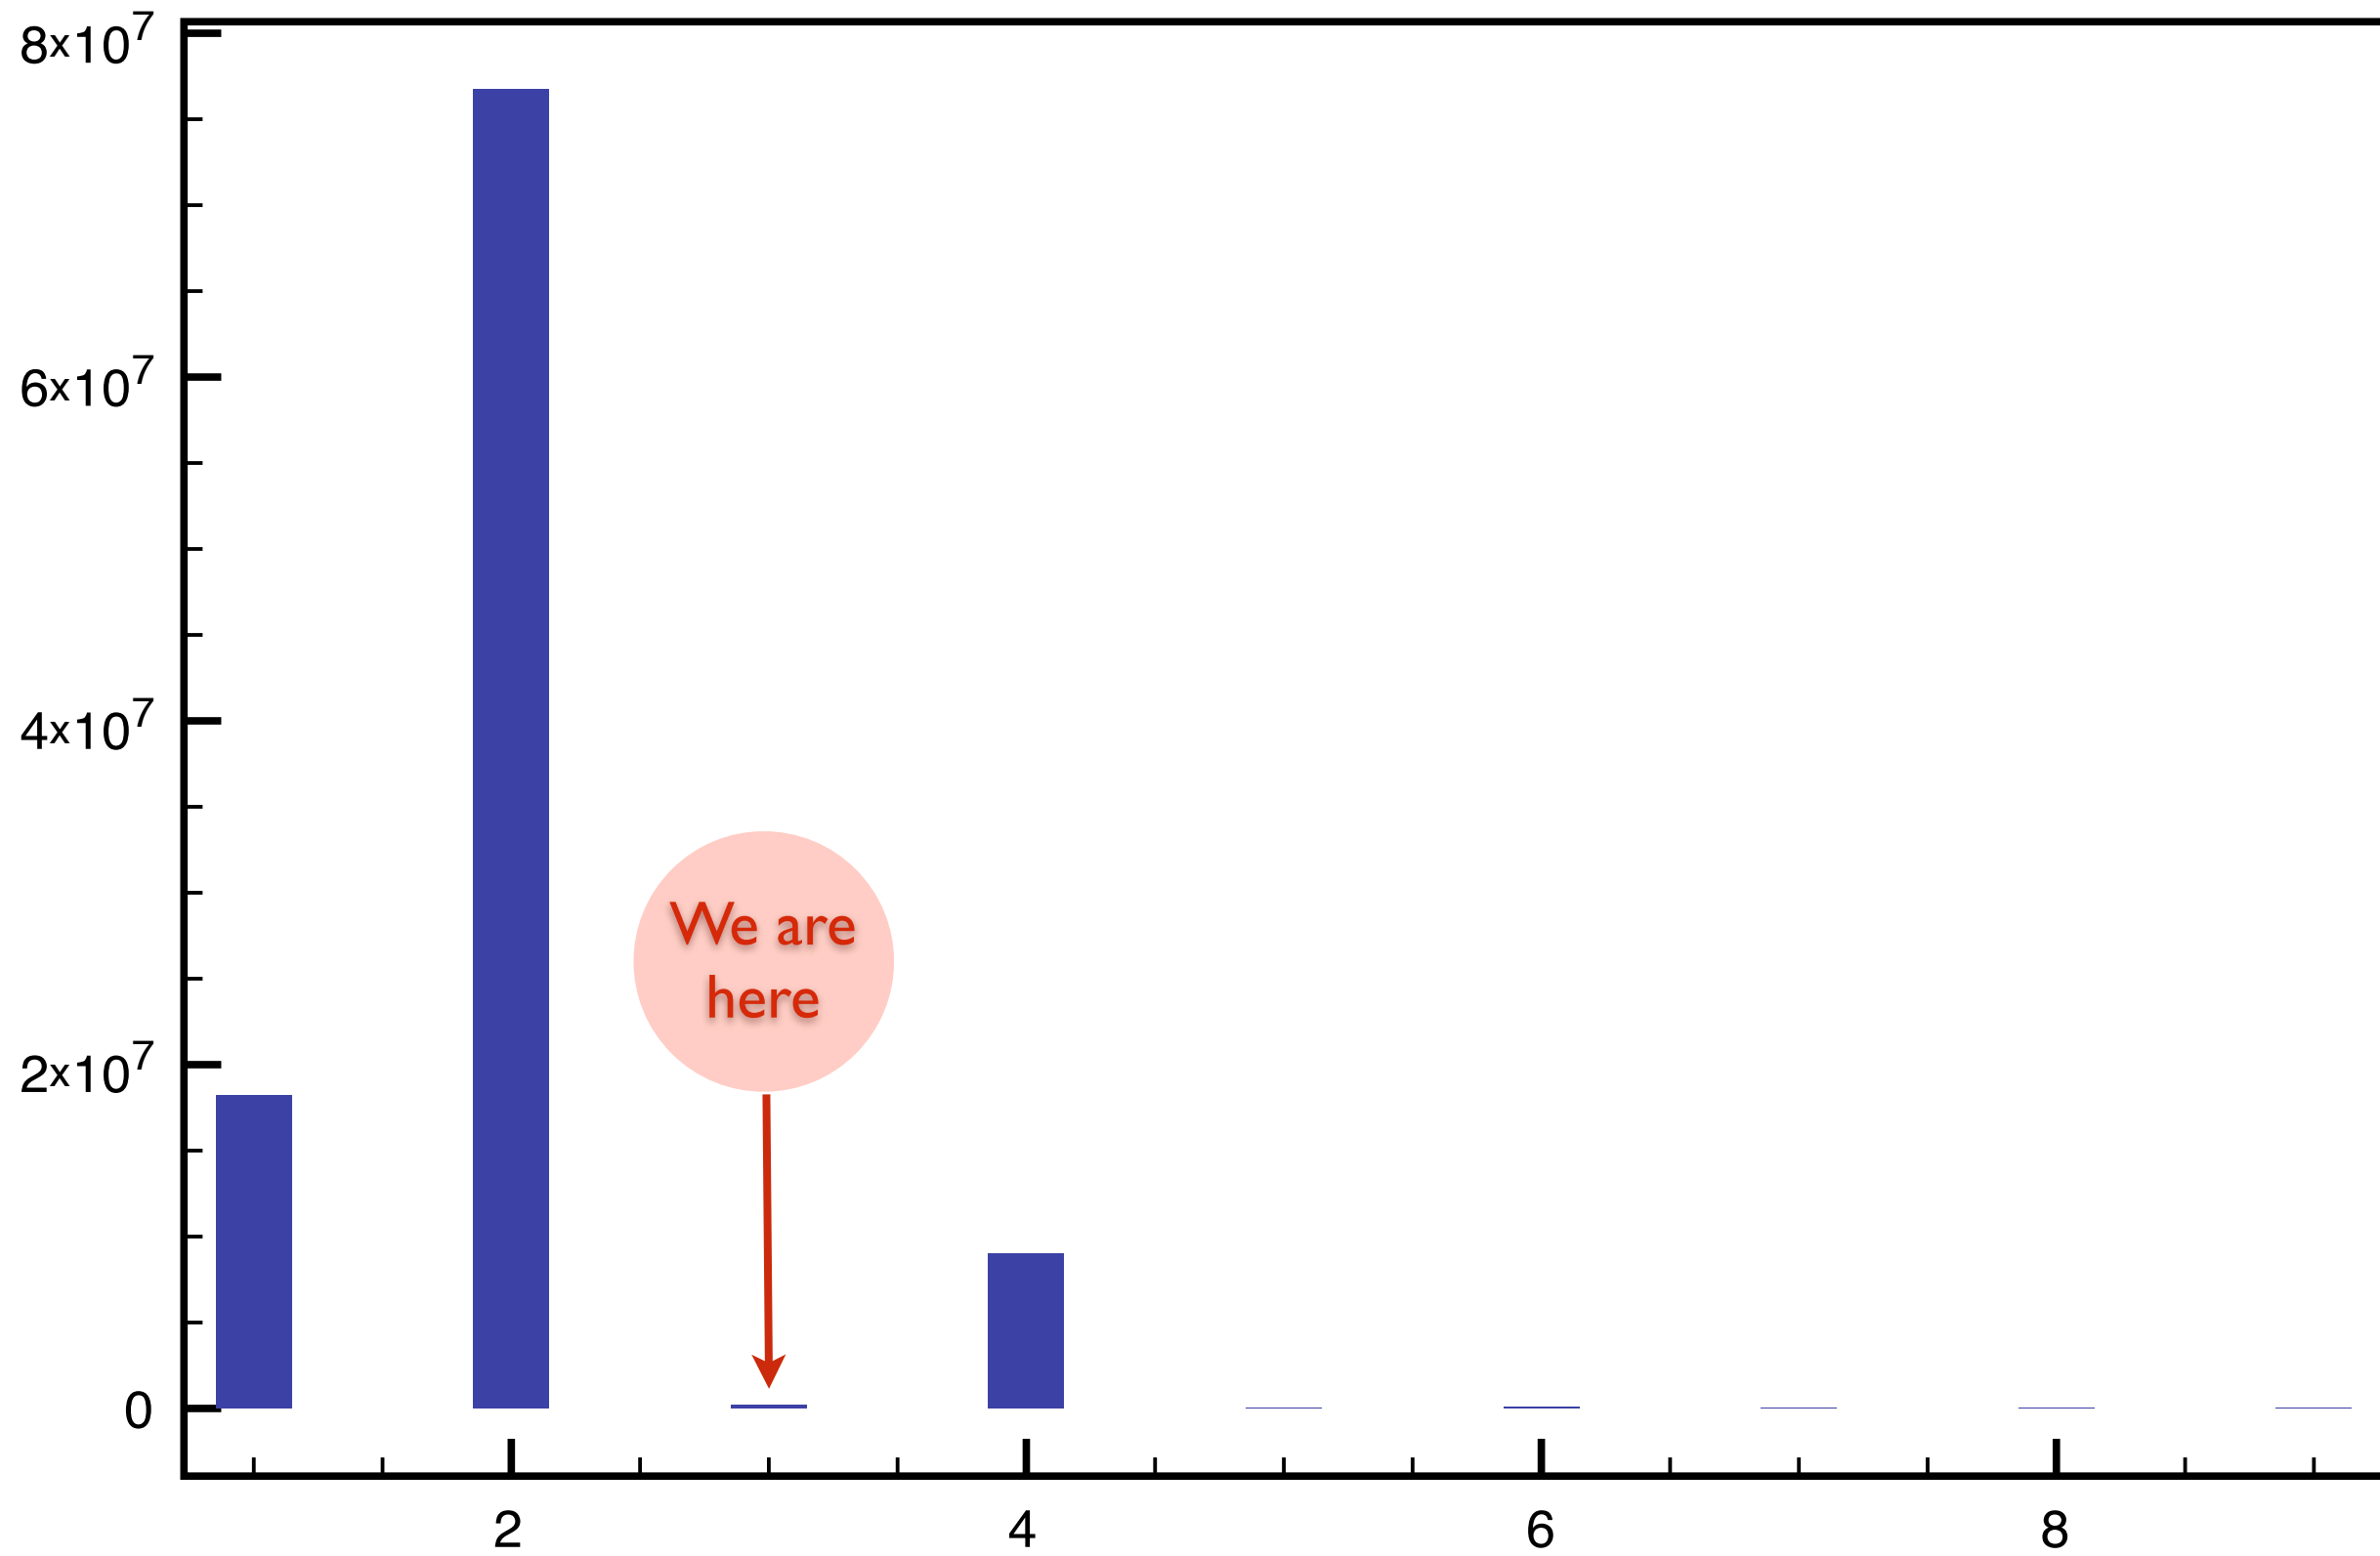

First realization of this picture was found at NIKHEF
(With Lennaert Huiszoon and Tim Dijkstra (2004))

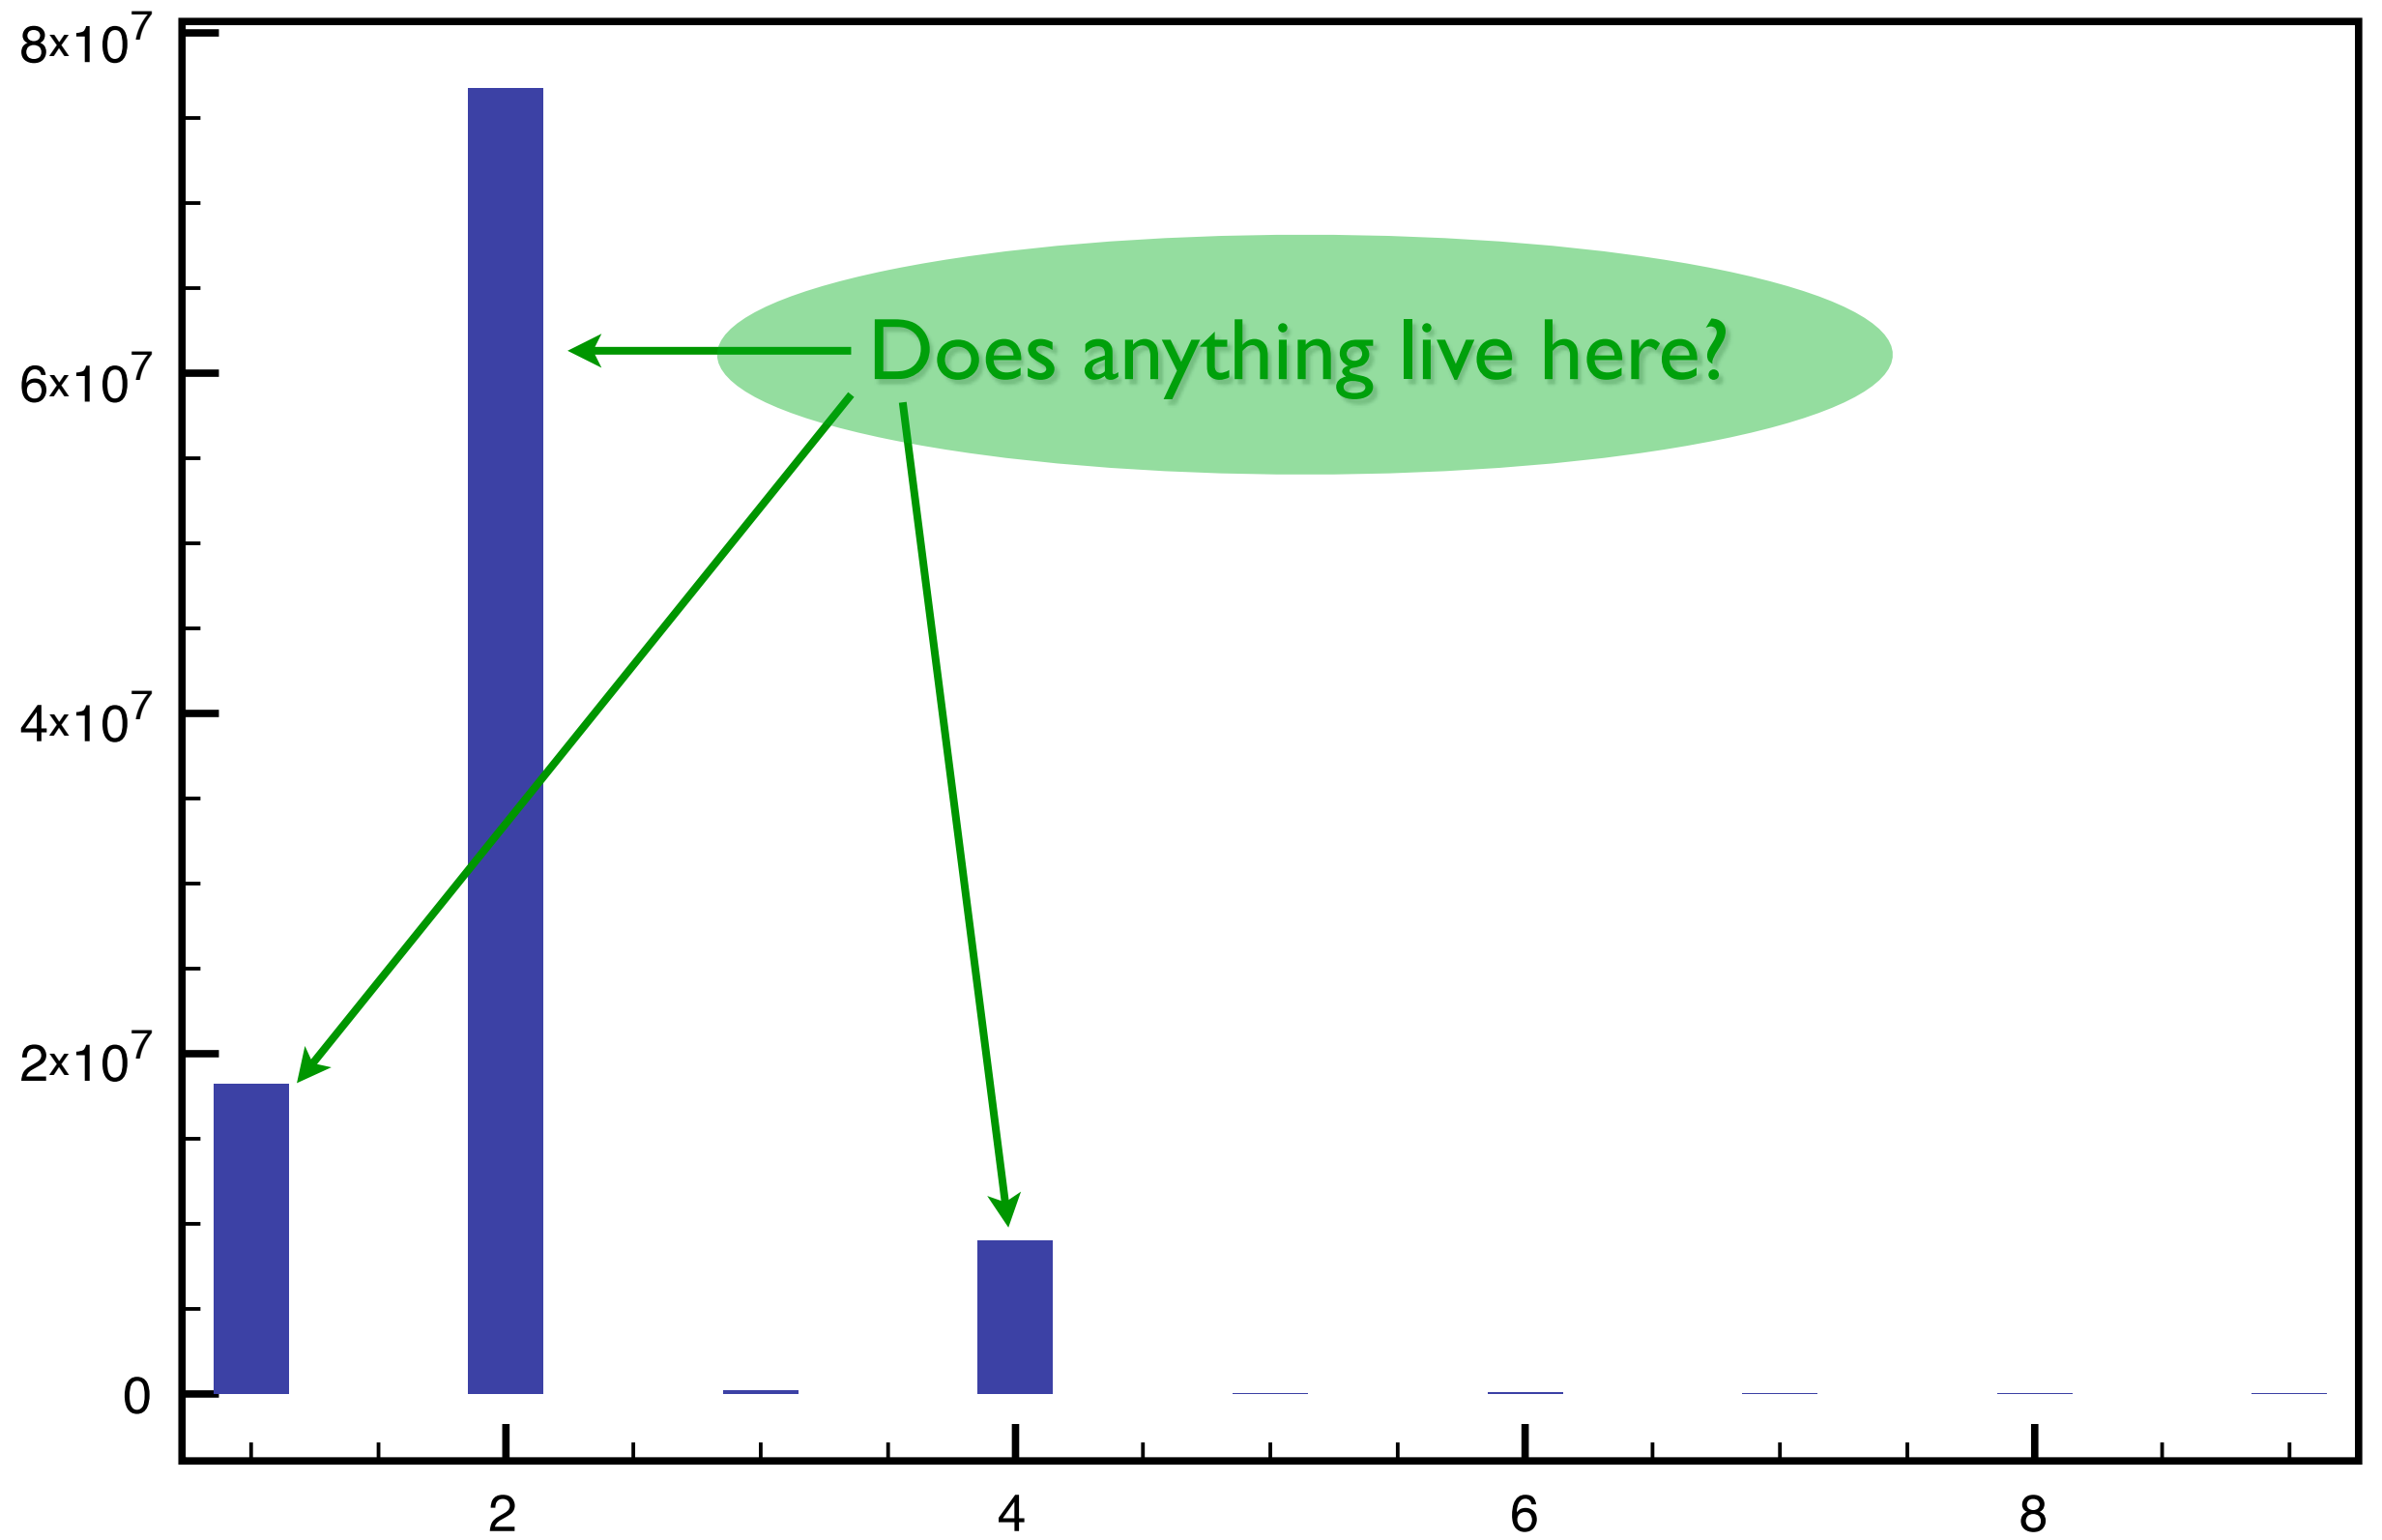

Signal-to-noise ratio $\sim 10^{-12}$

About 200.000 “events”.

(Supersymmetric standard model “modulo moduli”)

Standard Model from Heterotic Strings

With S.Yankielowicz (CERN, 1989)

Heterotic strings

- ✦ Closed strings (cylinder)

- ✦ Left- and right-moving modes can be treated separately

- ✦ Non-trivial constraints at one loop (torus)

Two classes of solutions

- Use free field theory in 2 dimensions, treat modes non-symmetrically
- Treat left- and right almost* symmetrically, but use interacting field theories (D. Gepner, 1987)

() Bosonic String Map (Lerche, Lüst, A.N.S. 1986)*

Automatically N families of (16)'s of $SO(10)$

Interacting

Non-symmetric
