

J.Vermaseren

The Difficult Sudoku Book

1 Introduction

Getting a little bored with easy sudokus? Or fed up with sudokus that require you to guess the solution? Or sudokus that have more than one solution? Or sudokus of which the degree of difficulty is given in very inflated terms like excruciating or extreme? In this book we have none of that. We have proper difficult sudokus with only one solution, that can be solved by direct reasoning. It is just that you need to know a number of techniques because they really are rather difficult. Just to make sure that you will not fail because you do not know all techniques involved, we explain first all techniques that have been used for the construction of these sudokus. If you think that this is like giving away the solutions you are quite mistaken. Even when you know all these techniques the sudokus are difficult. You will have to use many of them just to solve a single sudoku. Which ones and in which order is up to you. Each sudoku should keep you busy for at least an hour, probably much more, although it is of course possible that you are one of the very few who can do it faster. I am not one of those. It gives me a sense of achievement each time I solve one.

My first sudoku program I made when I had a book with a selection of sudokus and already the first one I could not solve. Neither could I solve the second one. I wrote a small program that worked by trial and error and it found more than 200000 solutions for the first sudoku and also quite a few solutions for the second. All the sudokus in that book had more than one solution. Yet, in the back they gave 'the solution' for each. I figure they must have used different or extra rules, but there was no explanation at all in the book. I considered the money I spent on it as wasted.

I got involved creating sudokus when my little handheld sudoku game machine was accidently dropped in the toilet and stopped functioning. It had a nearly limitless supply of games and I did not feel like the collections that I could buy in the shops were up to my standards. Hence one day I decided to make a computer program that would give me what I wanted. As is usual with computer projects, they run a little bit out of hand and take more time than you plan, but in this case at least the results were very satisfying. I programmed all techniques I knew and got a few more from the internet and used those together to determine whether a sudoku was solvable for someone with my techniques. There were a few more methods which I programmed, but I decided against using them as they came too close to trial and error methods which I do not really like. At the borderline is the method of coloring. It is OK as it goes, but it makes a mess of your pencilmarks, and hence it works best with special overlays. I decided to let you choose for yourself by making two sections: one that does not use coloring and one that may. The problem is that nearly all very difficult sudokus use at one time or another in their solution the coloring method.

In our collections we use some methods that are considered controversial in another respect. We guarantee that our sudokus have only a single solution and expect you to use that information. There are people who do not like this and in most published sudokus this method is not used. There are arguments for and against. In this book the argument for won.

To obtain a nice collection of sudokus I had the computer generate a collection of 600 million sudokus. Most of those are very simple and do not need any of the methods that are presented here. But there are some that can become very complicated. The trick was to recognize those and to collect them. One of the most important selection criteria was the variety of techniques needed to solve the sudoku. Some may need 13 different techniques or more. It means that you have to be continuously on the lookout for everything. The

exceptions are the sudokus that are used as examples for practicing in the sections that explain the methods. There as few techniques as possible are used, just to highlight what was explained.

For information we are much indebted to the people who have set up the internet sites sudokusnake.com and sudopedia.org. They explain a large variety of methods and give much side information. They have methods that are much more complicated than the ones used in this book. In some cases it becomes more academic and it may even be a whole science just to construct one or more sudokus that need those techniques. As we did not write this book as a textbook for scientists nor for professional training, we have left those techniques out. We believe these sudokus to be difficult enough already.

In all you should have many hours of sudoku pleasure.

2 Notation

We start with explaining our notation and nomenclature. We present all our sudokus in something we call a board. This board has coordinates as in

	A	B	C	D	E	F	G	H	I
1									
2									
3									
4									
5									
6									
7									
8									
9									

When we refer to a location on the board we first mention the number of the row and then the letter of the column. The highlighted cell on this board is at location 3F which indicates row 3 column F:

	A	B	C	D	E	F	G	H	I
1									
2									
3									
4									
5									
6									
7									
8									
9									

The 3x3 squares on the board are referred to as blocks. They have numbers as in

	A	B	C	D	E	F	G	H	I
1									
2		1			2			3	
3									
4									
5		4			5			6	
6									
7									
8		7			8			9	
9									

To make things a bit easier we will usually refer to the blocks also by name as in center-right (block 6) etc.

The names of many of the techniques have been taken from the internet. A site that has helped us very much is sudokusnake.com. They have very good explanations of many techniques. More than we present here although we present here some that they do not have. Probably because they do not like those. Another site with much information about sudokus is sudopedia.org.

3 Pencilmarks

When sudokus are easy, it is often not necessary to make notes on the side at all. Things become different when the sudokus go beyond the beginner level. We often like to make some notes about what we have derived till that moment. If it is not very complicated some simple notes in the margins will suffice, but when things become more and more complicated we like to make marks inside the empty cells about which numbers are still possible candidates for that cell. Then, when we make more and more progress towards a solution we can erase some of these possibilities. This is why it is best to make these marks in pencil and have a good eraser. Various people have various ways of making these 'pencilmarks' but for difficult sudokus we prefer a method in which each number has its own position in the cell. Let us look at how this works. The position is

	A	B	C	D	E	F	G	H	I
1		4	5	9	7	3		6	1
2	7	9			6		3		
3		3	6		8		7		9
4	4	5	3	6	1	8	9	7	2
5		2	7	3	5	9			
6	6		9	4	2	7	5		3
7	9			8	3	5			
8	3	6		7	4	2		9	5
9	5			1	9	6		3	

With the pencil marks it looks like

	A	B	C	D	E	F	G	H	I
1	² / ₈	4	5	9	7	3	² / ₈	6	1
2	7	9	^{1 2} / ₈	² / ₅	6	¹ / ₄	3	² / _{4 5 8}	⁴ / ₈
3	^{1 2}	3	6	² / ₅	8	¹ / ₄	7	² / _{4 5}	9
4	4	5	3	6	1	8	9	7	2
5	¹ / ₈	2	7	3	5	9	¹ / _{4 8}	¹ / _{6 4 8}	^{4 6} / ₈
6	6	¹ / ₈	9	4	2	7	5	¹ / ₈	3
7	9	¹ / ₇	^{1 2} / ₄	8	3	5	^{1 2} / _{4 6}	^{1 2} / _{4 7}	^{4 6} / ₇
8	3	6	¹ / ₈	7	4	2	¹ / ₈	9	5
9	5	^{7 8}	² / _{4 8}	1	9	6	⁴ / ₈	3	⁴ / _{7 8}

Of course, putting full pencil marks is a bit of work, specially when taking in consideration that when you make errors doing this the outcome may be fatal. But with the pencil marks it is easy to see what we can do.

	A	B	C	D	E	F	G	H	I
1	² / ₈	4	5	9	7	3	² / ₈	6	1
2	7	9	^{1 X} / ₈	² / ₅	6	¹ / ₄	3	² / _{4 5 8}	⁴ / ₈
3	^{1 2}	3	6	² / ₅	8	¹ / ₄	7	² / _{4 5}	9
4	4	5	3	6	1	8	9	7	2
5	¹ / ₈	2	7	3	5	9	¹ / _{4 8}	¹ / _{6 4 8}	^{4 6} / ₈
6	6	¹ / ₈	9	4	2	7	5	¹ / ₈	3
7	9	¹ / ₇	^{1 2} / ₄	8	3	5	^{1 2} / _{4 6}	^{1 2} / _{4 7}	^{4 6} / ₇
8	3	6	¹ / ₈	7	4	2	¹ / ₈	9	5
9	5	^{7 8}	² / _{4 8}	1	9	6	⁴ / ₈	3	⁴ / _{7 8}

The two highlighted cells in block 7 (left bottom) contain the only possible two's in that block. Hence one of them must be a 2. This means that other two's in column C are not possible and we can scratch the potential two in cell 2C.

	A	B	C	D	E	F	G	H	I
1	$\begin{smallmatrix} 2 \\ 8 \end{smallmatrix}$	4	5	9	7	3	$\begin{smallmatrix} 2 \\ 8 \end{smallmatrix}$	6	1
2	7	9	$\begin{smallmatrix} 1 \\ 8 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	6	$\begin{smallmatrix} 1 \\ 4 \end{smallmatrix}$	3	$\begin{smallmatrix} 2 \\ 4 \\ 5 \\ 8 \end{smallmatrix}$	$\begin{smallmatrix} 4 \\ 8 \end{smallmatrix}$
3	$\begin{smallmatrix} 1 \\ 2 \end{smallmatrix}$	3	6	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	8	$\begin{smallmatrix} 1 \\ 4 \end{smallmatrix}$	7	$\begin{smallmatrix} 2 \\ 4 \\ 5 \end{smallmatrix}$	9
4	4	5	3	6	1	8	9	7	2
5	$\begin{smallmatrix} 1 \\ 8 \end{smallmatrix}$	2	7	3	5	9	$\begin{smallmatrix} 1 \\ 4 \\ 6 \\ 8 \end{smallmatrix}$	$\begin{smallmatrix} 1 \\ 4 \\ 8 \end{smallmatrix}$	$\begin{smallmatrix} 4 \\ 6 \\ 8 \end{smallmatrix}$
6	6	$\begin{smallmatrix} 1 \\ 8 \end{smallmatrix}$	9	4	2	7	5	$\begin{smallmatrix} 1 \\ 8 \end{smallmatrix}$	3
7	9	$\begin{smallmatrix} 1 \\ 7 \end{smallmatrix}$	$\begin{smallmatrix} \times 2 \\ 4 \end{smallmatrix}$	8	3	5	$\begin{smallmatrix} 1 \\ 2 \\ 4 \\ 6 \end{smallmatrix}$	$\begin{smallmatrix} 1 \\ 2 \\ 4 \end{smallmatrix}$	$\begin{smallmatrix} 4 \\ 6 \\ 7 \end{smallmatrix}$
8	3	6	$\begin{smallmatrix} 1 \\ 8 \end{smallmatrix}$	7	4	2	$\begin{smallmatrix} 1 \\ 8 \end{smallmatrix}$	9	5
9	5	$\begin{smallmatrix} 7 \\ 8 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 4 \\ \times \end{smallmatrix}$	1	9	6	$\begin{smallmatrix} 4 \\ 2 \\ 8 \end{smallmatrix}$	3	$\begin{smallmatrix} 4 \\ 7 \\ 8 \end{smallmatrix}$

Next we see that the (highlighted) cells 2C and 8C only contain as possibilities the numbers 1 and 8. That means that in that column one cell must have the 1 and the other the 8. We just do not know which one gets what number. But it also means that in the C column no other position can have a 1 or an 8. Hence we can scratch the potential 1 in cell 7C and the potential 8 in cell 9C. Now it becomes a little more complicated and we really need the pencilmarks.

	A	B	C	D	E	F	G	H	I
1	$\begin{smallmatrix} 2 \\ 8 \end{smallmatrix}$	4	5	9	7	3	$\begin{smallmatrix} 2 \\ 8 \end{smallmatrix}$	6	1
2	7	9	$\begin{smallmatrix} 1 \\ 8 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	6	$\begin{smallmatrix} 1 \\ 4 \end{smallmatrix}$	3	$\begin{smallmatrix} \times 2 \\ 5 \\ \times \end{smallmatrix}$	$\begin{smallmatrix} 4 \\ 8 \end{smallmatrix}$
3	$\begin{smallmatrix} 1 \\ 2 \end{smallmatrix}$	3	6	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	8	$\begin{smallmatrix} 1 \\ 4 \end{smallmatrix}$	7	$\begin{smallmatrix} 2 \\ 4 \\ 5 \end{smallmatrix}$	9
4	4	5	3	6	1	8	9	7	2
5	$\begin{smallmatrix} 1 \\ 8 \end{smallmatrix}$	2	7	3	5	9	$\begin{smallmatrix} 1 \\ 4 \\ 6 \\ 8 \end{smallmatrix}$	$\begin{smallmatrix} 1 \\ 4 \\ 8 \end{smallmatrix}$	$\begin{smallmatrix} 4 \\ 6 \\ 8 \end{smallmatrix}$
6	6	$\begin{smallmatrix} 1 \\ 8 \end{smallmatrix}$	9	4	2	7	5	$\begin{smallmatrix} 1 \\ 8 \end{smallmatrix}$	3
7	9	$\begin{smallmatrix} 1 \\ 7 \end{smallmatrix}$	$\begin{smallmatrix} 4 \\ 2 \end{smallmatrix}$	8	3	5	$\begin{smallmatrix} 1 \\ 2 \\ 4 \\ 6 \end{smallmatrix}$	$\begin{smallmatrix} 1 \\ 2 \\ 4 \end{smallmatrix}$	$\begin{smallmatrix} 4 \\ 6 \\ 7 \end{smallmatrix}$
8	3	6	$\begin{smallmatrix} 1 \\ 8 \end{smallmatrix}$	7	4	2	$\begin{smallmatrix} 1 \\ 8 \end{smallmatrix}$	9	5
9	5	$\begin{smallmatrix} 7 \\ 8 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 4 \end{smallmatrix}$	1	9	6	$\begin{smallmatrix} 4 \\ 2 \\ 8 \end{smallmatrix}$	3	$\begin{smallmatrix} 4 \\ 7 \\ 8 \end{smallmatrix}$

If we look at the cells 2C, 2F and 2I we see that their possibilities are (1,8), (1,4) and (4,8) respectively. This means that for three positions in row 2 we have only three different numbers. Hence the numbers (1,4,8) have to occur in those three positions and nowhere else in that row. Therefore we can scratch the potential 4 and 8 in cell 2H.

	A	B	C	D	E	F	G	H	I
1	² ₈	4	5	9	7	3	² ₈	6	1
2	7	9	¹ ₈	² ₅	6	¹ ₄	3	² ₅ ₄ ₈	
3	¹ ₂	3	6	² ₅	8	¹ ₄	7	² ₄ ₅	9
4	4	5	3	6	1	8	9	7	2
5	¹ ₈	2	7	3	5	9	¹ ₄ ₆ _X	¹ ₄ ₈	⁴ ₆ _X
6	6	¹ ₈	9	4	2	7	5	¹ ₈	3
7	9	¹ ₇	² ₄	8	3	5	¹ ₄ ₆	¹ ₄ ₆	⁴ ₇ ₆
8	3	6	¹ ₈	7	4	2	¹ ₈	9	5
9	5	² ₇ ₈	⁴ ₂	1	9	6	⁴ ₈	3	⁴ ₇ ₈

Next we notice that the cells 5H and 6H contain the only possible 8's in column H and hence one of the two must contain the number 8. As a consequence we can scratch the other potential eights in block 6 (right center). This is in the cells 5G and 5I. And now the last step before things become simple again:

	A	B	C	D	E	F	G	H	I
1	² ₈	4	5	9	7	3	² ₈	6	1
2	7	9	¹ ₈	² ₅	6	¹ ₄	3	² ₅ ₄ ₈	
3	¹ ₂	3	6	² ₅	8	¹ ₄	7	^X ₄ _X	9
4	4	5	3	6	1	8	9	7	2
5	¹ ₈	2	7	3	5	9	¹ ₄ ₆	¹ ₄ ₈	⁴ ₆
6	6	¹ ₈	9	4	2	7	5	¹ ₈	3
7	9	¹ ₇	² ₄	8	3	5	¹ ₄ ₆	¹ ₄ ₆	⁴ ₇ ₆
8	3	6	¹ ₈	7	4	2	¹ ₈	9	5
9	5	² ₇ ₈	⁴ ₂	1	9	6	⁴ ₈	3	⁴ ₇ ₈

We look at the (highlighted) cells 2D, 3D, 2H, 3H. The step we apply now takes into account that there is only one solution for the sudoku. This is a given fact for all sudokus in this book. We notice that all four cells have as potential number the numbers 2 and 5 and cell 3H can also take the value 4. The observation is now that if cell 3H takes the value 2 or 5 the other cells are forced into the values 2 or 5 for 2D and 5 or 2 for 3D and 2H. But either choice would leave a proper position that does not affect anything else on the board. Hence the solution is not unique if we select either the 2 or the 5 for cell 3H. But we know that there is only one solution. Therefore the solution for cell 3H must be the 4. We can scratch the possibilities 2 and 5 for this cell. We have reached now the point that we can actually determine that we have to put the number 4 in cell 3H. After this the solution of the sudoku is straight forward.

We see here that when the sudokus become complicated the main action takes place with the pencilmarks. Hence they are indispensable for the complicated sudokus in the main

section of the book. This is why the sudokus are printed rather large. It allows for more than enough space for the pencilmarks.

4 The methods

Below we will present all methods that have been used at one stage or another in composing the sudokus in this book. We have ordered them more or less by difficulty, starting with the easy ones. For the classification of the difficulty we use two systems. One is the classification used on the internet site sudokusnake.com but adapted to our needs as they do not use the method of uniqueness and we do. Also we think that sets of 4 or 5 elements are considerably harder to spot than sets of 2 elements. The main problem we have with their scoring though is the fact that if one uses the same method 5 times its point value gets added 5 times to the score while we believe that the sudoku does not become that much harder when you keep using the same method. Hence our score, called difficulty, gives a certain point value when a method is used first and a much smaller point value for each further use. The difference is very much noticeable when you look at the most difficult sudokus. In the case of the sudoku scoring one sees a relatively small variety of methods, in which the more complicated one is used many times, while with the difficulty method one sees the application of as many different methods as possible. We have seen sudokus with 13 or more different methods (counting sets of 2, sets of 3 etc as different methods). We prefer the variety in the methods as it seems more adventurous. Only for the examples of the methods we have made an exception, because there the didactic aspect is more important. There we have gone to some extremes, selecting very special sudokus from a sample of hundreds of million sudokus.

Some of the methods are defined differently on different sites of the internet. This leaves us to interpret things our way. This is particularly important with the coloring method. This can be made arbitrarily complicated and the result is that depending on the definition one may come very close to trial and error. Hence in the first selection of sudokus we have left out the coloring method, while in the second selection we have included it in a relatively mild form.

Another method for which the internet sites have different definitions is the swordfish and the jellyfish. The original definition was a cyclic one with each row allowing twice the candidate number. Later a much more general definition was discovered. It is this definition that we use.

If one looks at sites like sudokusnake.com one sees many much more complicated methods defined. We have not included those (yet?). As is, the sudokus are already difficult enough and should take at least an hour to solve, possibly much more. Also the more difficult techniques are much rarer and hence it is much more difficult to find good examples of them. In addition some of them seem to be solvable when one stretches the definition of coloring a bit. It becomes a matter of what one considers allowable and what not. Then there is the definition of forcing chains. We have seen two completely different definitions. At the moment we have left out this method completely. It can be very powerful though, but at the same time it is very complicated and may be crossing the borderline and be marked as a trial and error method.

With the methods below we can solve about 75 % of randomly generated sudokus (once they fulfill the requirement that they have only a single solution). Trial and error techniques will solve all of course but that technique we do not want to apply. Hence our sudokus are selected from those 75%. Of those most are very simple and require none of the methods

presented below (60% or more). Hence our strategy is to generate very many sudokus and then select the few that have an interesting profile when we study which methods they need for their solution.

It is of course not excluded that if you know fancier methods than the ones that follow, you can solve some of the sudokus much quicker. Good for you. Knowledge is power.

5 Pointing

The first technique one should learn is the pointing technique. In a given block all occurrences of possibilities for a given number are either in the same row or the same column. See for instance the example:

	A	B	C	D	E	F	G	H	I
1	¹ ₉ 1	4	5	¹ _{8 9} 6	¹ _{8 9} 6	3	2	⁶ ₉ 7	7
2	² ₉ 7	⁶ ₈ 7	⁶ _{8 9} 4	⁶ _{8 9} 4	⁶ _{8 9} 4	² ₈ 1	5	3	3
3	^{1 2} ₉ 3	¹ ₆ 3	^{1 2} ₉ 3	^{1 2} ₉ 7	5	⁴ _{8 9} 6	⁴ ₉ 6	⁴ _{8 9} 6	⁶ _{8 9} 4
4	3	2	9	4	5	6	¹ _{7 8} 7	¹ ₈ 1	1
5	¹ ₈ 4	¹ ₈ 5	3	2	7	⁶ _{8 9} 3	¹ ₉ 6	¹ ₉ 5	5
6	6	5	7	¹ _{8 9} 4	¹ _{8 9} 4	¹ ₈ 3	^{1 2} _{4 9} 3	^{1 2} _{4 8 9} 4	^{1 2} _{4 8 9} 6
7	8	9	¹ _{4 6} 7	¹ _{4 6} 7	^{1 2} ₄ 5	5	3	^{1 2} _{4 6} 3	^{1 2} ₆ 6
8	5	3	¹ _{4 6} 8	^{1 2} _{6 8} 4	¹ _{6 8} 9	⁴ ₇ 6	^{1 2} ₇ 6	^{1 2} _{4 6} 4	^{1 2} ₆ 6
9	¹ ₆ 7	2	5	3	¹ ₄ 3	⁴ _{6 9} 8	8	¹ _{4 6 9} 8	¹ _{6 9} 8

The possible positions for the number 8 (and the number 4) for block 3 (right top) are all in row 3. Because there must be a number 8 in this block it will be in row 3. Hence in the rest of row 3 there can be no number 8 and we can scratch those possibilities. This is done in 3A, 3B and 3D. The same holds of course for columns as in

	A	B	C	D	E	F	G	H	I
1	⁵ _{4 8} 5	² ₈ 9	9	⁴ ₆ 7	7	3	² _{7 8} 3	⁶ ₈ 1	1
2	³ _{7 8} 4	¹ _{7 8} 4	³ ₈ 4	¹ _{4 6} 4	^{5 6 4}	2	⁵ _{7 8} 2	⁶ ₈ 9	9
3	³ ₇ 1	^{1 2} ₇ 6	6	¹ ₉ 5	8	8	^{2 3} ₇ 4	³ ₇ 4	³ ₇ 4
4	³ _{4 7 8} 5	5	1	^{2 3} _{4 7} 4	² _{4 8} 6	6	³ _{7 8} 6	³ ₇ 9	³ ₇ 9
5	⁹ _{7 8} 9	⁴ _{7 8} 6	⁴ ₈ 4	³ ₇ 4	³ ₈ 1	1	³ _{7 8} 6	2	5
6	³ _{7 8} 2	⁶ _{7 8} 2	2	³ _{7 9} 5	³ _{8 9} 5	5	³ _{7 8} 6	1	4
7	2	9	5	8	1	7	4	3	6
8	⁶ _{4 8} 6	⁴ ₈ 3	7	5	3	9	1	7	2
9	1	3	7	² ₆ 4	² ₆ 4	4	9	5	8

The number 8 in block 6 (right middle) occurs only in column G. Hence we can scratch the possibilities for the number 8 in the other blocks in this column.

Here is an example to practice the pointing technique:

	A	B	C	D	E	F	G	H	I
1			4		2		5		
2				5	7		9		
3					1				
4		4	9						6
5			8			9			5
6		7	3						
7	2		5					1	4
8						2			8
9						8		6	

6 Claiming

Claiming is very much related to pointing, but usually a little harder to see. If all occurrences of possibilities for a given number in a certain row or column are inside the same block, we may eliminate the other potential occurrences of this number inside that block. As in the example:

	A	B	C	D	E	F	G	H	I
1	² 5 8	6	X ^{2 3} 4 5 8	^{1 2} 5	^{2 3} 4 5	9	⁵ 8	^{1 3} 5 8	7
2	² 5	^{1 3} 4 5	^{1 2 3} 4 5	7	^{2 3} 4 5	8	⁵ 8	³ 9	6
3	9	7	X ³ 5 8	¹ 5	⁵ 8	6	2	^{1 3} 5 8	4
4	1	4	^{5 6} 8	9	⁵ 7 8	3	^{5 6} 7 8	⁵ 7 8	2
5	^{5 6} 8	2	^{5 6} 8	⁵ 8	⁵ 7 8	1	^{4 5 6} 7 8	^{4 5 3} 6 7 8	9
6	3	9	7	4	6	2	⁵ 8	⁵ 8	1
7	4	5	9	² 8	² 8	7	1	6	3
8	² 7 6	8	² 6	3	1	4	9	² 7	5
9	² 7	^{1 3} 4 5	^{1 2 3} 4 5	6	9	5	⁴ 7	⁴ 7	8

In row 2 the only possible occurrences of the number 1 are in block 1 (left top). Hence we can eliminate the possibilities for number 1 in the positions 1C and 3C. Again this works also with columns:

	A	B	C	D	E	F	G	H	I
1	8	6	7	² _{5 9} 4	² _{5 9} 4	² _{5 9}	^{2 3} ₉	^{2 3} ₉	1
2	4	1	5	² ₉	7	3	² _{8 9}	² _{8 9}	6
3	3	2	9	6	8	1	7	4	5
4	1	4	6	8	2	⁵ ₉	³ _{5 9}	³ _{5 9}	7
5	⁵ ₉	3	2	^{4 5} _{7 9}	1	^{4 5} _{7 9}	6	⁵ _{8 9}	⁴ _{8 9}
6	⁵ ₉	7	8	3	6	^{4 5} ₉	¹ _{4 5 9}	¹ _{5 9}	2
7	2	5	1	⁴ _{7 9}	3	6	⁴ _{8 9}	^{7 8 9} _{4 8 9}	⁴ _{8 9}
8	6	_{8 9}	3	⁴ _{7 9} 5	⁵ ₉	⁴ _{7 8 9} 5	^{1 2} _{4 5 9}	^{1 2} _{5 9}	⁴ ₉
9	7	_{8 9}	4	1	⁵ ₉	² _{8 9}	² _{5 9}	6	3

The number 5 in column E is only possible inside block 8 (middle bottom). Hence we can scratch the possibilities for number 5 in the positions 8D, 8F, 9F.

Next an example to practice the claiming technique.

	A	B	C	D	E	F	G	H	I
1		5			3				4
2			4		5		2		
3	1		2			4	8	6	
4	8			2			9		
5	3					8		7	
6	7								6
7				5			6		
8									
9		1			4		5		

7 Sets

The concept of sets is very fundamental and it is almost impossible to think of sudokus that are not at the very beginners level without sets. The idea is rather simple:

	A	B	C	D	E	F	G	H	I
1	2	1	6	9	3	8	7	4	5
2	9	7	4	^{1 2} ₅	² ₅	^{1 2}	8	6	3
3	5	³ ₈	³ ₈	7	4	6	^{1 2}	9	^{1 2}
4	7	9	5	^{1 2}	6	3	^{1 2}	8	4
5	³ ₈	^{2 3} ₈	1	4	² _{5 8}	9	6	³ ₅	7
6	4	6	^{2 3} ₈	^{1 2} _{5 8}	7	^{1 2}	9	³ ₅	^{1 2}
7	6	5	^{2 3} ₈	^{2 3} ₈	² ₈	7	4	1	9
8	1	4	7	6	9	5	3	2	8
9	³ ₈	^{2 3} ₈	9	^{2 3} ₈	1	4	5	7	6

Consider the cells 6F and 6I. Both have the same two possibilities: the numbers 1 and 2. This means that one cell must get number 1 and the other number 2. It is just not determined yet which one will obtain which value. But it means that those two positions provide the numbers 1 and 2 in row 6, and hence other positions in that row cannot have the numbers 1 or 2. This means that we can scratch the potential 1 and 2's in the positions 6C and 6D. This holds of course also for columns:

	A	B	C	D	E	F	G	H	I
1	^{2 3} _{4 8 9}	^{2 3} _{6 8 9}	^{2 3} _{4 8 9}	1	^{2 3} ₉	7	² ₉	^{4 6}	5
2	^{2 3} _{4 5 7}	^{2 3} _{6 7 9}	^{2 3} _{4 6 7 9}	^{2 3} _{5 9}	^{2 3} ₉	8	² ₉	^{4 6}	1
3	² _{5 9}	² ₉	1	6	4	² _{5 9}	3	^{7 8}	^{7 8}
4	6	^{1 2} _{8 9}	² _{8 9}	7	5	^{1 2} ₉	¹ ₈	3	4
5	⁴ ₇	³ _{5 7}	⁴ _{3 7}	8	¹ ₆	¹ ₆	¹ ₇	⁶ ₉	2
6	² _{7 8 9}	^{1 2} _{7 8 9}	² _{7 8 9}	4	^{1 2} _{6 9}	3	¹ _{7 8}	^{5 6} _{7 8}	^{1 5} _{7 8}
7	³ _{8 9}	³ _{8 9}	³ _{8 9}	³ _{5 9}	7	¹ _{4 5 9}	¹ _{4 5 8}	2	6
8	1	² _{7 8 9}	5	² ₉	² _{8 9}	² _{6 9}	⁴ _{7 8}	^{7 8}	3
9	^{2 3} _{7 8}	4	^{2 3} _{7 8}	^{2 3} ₅	^{1 2 3} ₈	^{1 2} _{5 6}	¹ _{7 8}	¹ ₅	9

and for blocks:

	A	B	C	D	E	F	G	H	I
1	$\begin{smallmatrix} 1 \\ 4 \end{smallmatrix} \times$	9	$\begin{smallmatrix} 2 \\ 4 \end{smallmatrix} \times$	$\begin{smallmatrix} 2 \ 3 \\ 4 \end{smallmatrix}$	$\begin{smallmatrix} 2 \ 3 \\ 4 \end{smallmatrix}$	7	$\begin{smallmatrix} 1 \ 2 \ 3 \\ 5 \end{smallmatrix}$	6	8
2	$\begin{smallmatrix} 1 \\ 4 \end{smallmatrix} \times$	$\begin{smallmatrix} 2 \\ 6 \end{smallmatrix}$	7	8	$\begin{smallmatrix} 2 \ 3 \\ 4 \ 6 \ 9 \end{smallmatrix}$	$\begin{smallmatrix} 3 \\ 6 \ 9 \end{smallmatrix}$	$\begin{smallmatrix} 1 \ 2 \ 3 \\ 5 \end{smallmatrix}$	$\begin{smallmatrix} 1 \\ 5 \end{smallmatrix}$	$\begin{smallmatrix} 5 \\ 5 \end{smallmatrix} \ 3$
3	$\begin{smallmatrix} 2 \\ 6 \end{smallmatrix}$	8	3	5	$\begin{smallmatrix} 2 \\ 6 \end{smallmatrix}$	1	7	4	9
4	$\begin{smallmatrix} 4 \\ 6 \end{smallmatrix}$	5	8	$\begin{smallmatrix} 1 \\ 4 \ 6 \ 7 \end{smallmatrix}$	$\begin{smallmatrix} 3 \\ 4 \ 6 \ 7 \end{smallmatrix}$	$\begin{smallmatrix} 1 \\ 4 \ 6 \ 4 \end{smallmatrix}$	$\begin{smallmatrix} 3 \\ 4 \ 6 \ 4 \end{smallmatrix}$	$\begin{smallmatrix} 3 \\ 4 \ 6 \ 4 \end{smallmatrix}$	9 2
5	7	$\begin{smallmatrix} 3 \\ 6 \end{smallmatrix}$	1	9	$\begin{smallmatrix} 4 \ 5 \ 6 \\ 4 \ 5 \ 6 \end{smallmatrix}$	2	$\begin{smallmatrix} 4 \ 5 \ 6 \\ 4 \ 5 \ 6 \end{smallmatrix}$	8	$\begin{smallmatrix} 3 \\ 5 \ 6 \end{smallmatrix}$
6	$\begin{smallmatrix} 2 \\ 4 \ 6 \ 9 \end{smallmatrix}$	$\begin{smallmatrix} 2 \ 3 \\ 6 \ 4 \ 6 \ 9 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 6 \ 4 \ 6 \ 9 \end{smallmatrix}$	$\begin{smallmatrix} 3 \\ 4 \ 6 \ 4 \ 6 \ 9 \end{smallmatrix}$	$\begin{smallmatrix} 3 \\ 4 \ 5 \ 6 \end{smallmatrix}$	8	$\begin{smallmatrix} 4 \ 5 \ 6 \\ 4 \ 5 \ 6 \end{smallmatrix}$	7	1
7	8	1	$\begin{smallmatrix} 6 \\ 9 \ 7 \end{smallmatrix}$	$\begin{smallmatrix} 3 \\ 7 \end{smallmatrix}$	$\begin{smallmatrix} 3 \\ 7 \end{smallmatrix}$	5	$\begin{smallmatrix} 6 \\ 9 \end{smallmatrix}$	2	4
8	$\begin{smallmatrix} 2 \\ 6 \ 9 \end{smallmatrix}$	4	5	$\begin{smallmatrix} 1 \ 2 \\ 6 \end{smallmatrix}$	8	$\begin{smallmatrix} 6 \\ 9 \end{smallmatrix}$	$\begin{smallmatrix} 1 \\ 6 \ 9 \end{smallmatrix}$	3	7
9	3	7	$\begin{smallmatrix} 2 \\ 6 \ 4 \ 6 \ 9 \end{smallmatrix}$	$\begin{smallmatrix} 1 \ 2 \\ 4 \ 6 \ 4 \ 6 \ 9 \end{smallmatrix}$	$\begin{smallmatrix} 1 \ 2 \\ 4 \ 6 \ 4 \ 6 \ 9 \end{smallmatrix}$	$\begin{smallmatrix} 4 \\ 6 \ 4 \ 6 \ 9 \end{smallmatrix}$	8	$\begin{smallmatrix} 1 \\ 5 \end{smallmatrix}$	$\begin{smallmatrix} 5 \\ 5 \ 6 \end{smallmatrix}$

The concept of sets holds also for bigger groups of numbers. When we look at the following situation we see that the three colored cells contain the only occurrences of the three numbers 2, 7 and 9 in row 3. That means that one of the three must be 2, another 7 and the third must be 9. We just do not know which one will have what number. But it means that other cells in row 3 cannot have the numbers 2, 7 or 9 and hence we can scratch the possibilities 2 and 7 in cell 3E.

	A	B	C	D	E	F	G	H	I
1	7	3	$\begin{smallmatrix} 6 \\ 8 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 6 \ 9 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 6 \ 8 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 4 \ 6 \ 8 \end{smallmatrix}$	$\begin{smallmatrix} 1 \ 2 \\ 4 \end{smallmatrix}$	$\begin{smallmatrix} 1 \ 2 \\ 9 \end{smallmatrix}$	5
2	5	$\begin{smallmatrix} 2 \\ 9 \end{smallmatrix}$	1	$\begin{smallmatrix} 2 \\ 7 \ 9 \end{smallmatrix}$	3	$\begin{smallmatrix} 4 \\ 4 \ 7 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 7 \end{smallmatrix}$	8	6
3	4	$\begin{smallmatrix} 2 \\ 9 \end{smallmatrix}$	$\begin{smallmatrix} 6 \\ 8 \end{smallmatrix}$	1	$\begin{smallmatrix} \times \\ \times \ 8 \end{smallmatrix}$	5	3	$\begin{smallmatrix} 2 \\ 7 \ 9 \ 7 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 7 \end{smallmatrix}$
4	1	7	2	5	$\begin{smallmatrix} 6 \\ 8 \end{smallmatrix}$	9	$\begin{smallmatrix} 6 \\ 8 \end{smallmatrix}$	4	3
5	6	4	9	3	$\begin{smallmatrix} 2 \\ 7 \ 8 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 8 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 5 \ 7 \ 8 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 5 \ 7 \end{smallmatrix}$	1
6	3	8	5	$\begin{smallmatrix} 2 \\ 7 \end{smallmatrix}$	$\begin{smallmatrix} 6 \\ 6 \end{smallmatrix}$	4	1	$\begin{smallmatrix} 2 \\ 7 \ 6 \ 7 \end{smallmatrix}$	9
7	9	1	4	8	5	3	$\begin{smallmatrix} 2 \\ 7 \end{smallmatrix}$	6	$\begin{smallmatrix} 2 \\ 7 \end{smallmatrix}$
8	8	5	7	$\begin{smallmatrix} 2 \\ 6 \end{smallmatrix}$	1	$\begin{smallmatrix} 2 \\ 6 \end{smallmatrix}$	9	3	4
9	2	6	3	4	9	7	$\begin{smallmatrix} 1 \\ 5 \end{smallmatrix}$	$\begin{smallmatrix} 1 \\ 5 \end{smallmatrix}$	8

Of course sets of three are a bit harder to spot than sets of two. And of course we can generalize this to sets of four (four cells that have the only occurrences of four numbers in a given row, column or block) and even five or more. For reasons we explain in the section on hidden sets we stop at five when testing for sets. Some examples:

	A	B	C	D	E	F	G	H	I
1	9	5	8	1	6	2	4		
2	7	3	3	4	4	1	5		
3	4	6	6	6	4	8	7		
4	5	4	3	3	2	1	2		
5	1	2	2	5	2	2	3		
6	2	8	2	4	1	1	6		5
7	4	6	6	6	9	5	4		
8	8	2	5	2	4		1		7
9	4	6	6	6	8	5			

	A	B	C	D	E	F	G	H	I
1	5	5	4	9	6	1	7	3	2
2	7	6	7	4	3	2	6	5	8
3	2	3	2	7	5	8	4	4	1
4	4	4	8	1	4	3	4	9	6
5	4	7	2	2	4	6	1	5	
6	4	1	6	5	4	8	7	4	
7	4	4	5	8	7	5	4	4	
8	4	4	5	8	7	5	4	1	9
9	3	2	9	6	1	4	5	8	7

And now some sudokus to practice sets:

	A	B	C	D	E	F	G	H	I
1	6	7			5				4
2				1		6			
3		3	5						
4									5
5				3	9				
6	2					4			
7	7	4		9			6	1	
8					8		2		3
9				6	2			5	7

	A	B	C	D	E	F	G	H	I
1	4	1							5
2			7		6	2		4	
3			2			8	7		
4					2				
5			3		8		2		
6	9		8						
7					1	5		3	
8				6			4		
9	7				4			6	

	A	B	C	D	E	F	G	H	I
1		9		7				8	
2					9				
3	6			1					
4			1					7	9
5		2							
6		8	4				5	1	
7	4				1	3			
8	8		7						2
9						5		9	3

	A	B	C	D	E	F	G	H	I
1		1	5				6		
2			6		8	2			1
3		3				1		5	
4		5	9		4				
5					2				
6		8	3			6			
7	3			1			9		
8		4			3	9		2	
9							1		7

The last one may be a bit hard to find.

8 Hidden sets

The concept of hidden sets is complementary to that of regular sets. Consider the following situation:

	A	B	C	D	E	F	G	H	I
1	³ 1 8	⁵ 6 8	¹ 3 ⁵ 6	¹ 5	¹ 2 ⁵ 8	9	7	4	¹ 2 ⁵
2	⁴ 7	¹ 5 7	2	3	¹ 4 ⁵ 7	¹ 4 7	6	8	9
3	9	⁷ 8 X	¹ 4 ⁵	¹ 4 ⁵	⁷ 8 X	6	3	¹ 2 ⁵	¹ 2 ⁵
4	² 3 ⁷ 8	¹ 5 ⁶ 8	¹ 3 ⁵ 6	9	¹ 5 ⁶ 7	¹	4	¹ 2 ⁶ 8	¹ 2 ³
5	⁴ 8	9	¹ 4 ⁶	2	¹ 4 ⁶	3	5	7	¹ 8
6	² 3 ⁴ 7	¹ 5 7	¹ 3 ⁴ 5	¹ 4 5	¹ 4 ⁵ 6	8	9	¹ 2 ⁶	¹ 2 ³
7	6	3	8	7	9	2	1	5	4
8	1	4	7	8	3	5	2	9	6
9	5	2	9	6	¹ 4	¹ 4	8	3	7

In row 3 the two colored cells 3B and 3E are the only two cells that could possibly obtain the numbers 7 or 8. Hence they must obtain those values and the other possibilities in those two cells can be scratched after which we see that these two cells form a set of two. One could obtain the same result if one looks at the other four cells in this row that do not have a fixed value yet. They form a set of four with the values 1, 2, 4 and 5. This mechanism is always present: if there is a hidden set the complementary cells form a set. We consider that it is easier to spot a hidden set of two than a set of four and hence give priority to looking for the shorter hidden set.

Of course one can also have hidden sets of three:

	A	B	C	D	E	F	G	H	I
1	¹ 5 8 9	¹ 8 9	^X 2 4 X	² 7 X	² 4 X	6	¹ 8 9	3	¹ 5 8 9
2	³ 5 6 8 9	³ 6 8 9	⁴ 5 6 8	⁵ 9	⁴ 8	1	⁶ 8 9	7	2
3	¹ 3 5 6 8 9	7	¹ 2 5 6 8	² 3 5 9	² 8	³ 8 9	4	¹ 6 8	¹ 5 6 8 9
4	¹ 5 6 8 9	¹ 6 8 9	¹ 5 6 8	¹ 2 6 9	¹ 2 6	4	7	¹ 2 6 8	3
5	¹ 3 6 8 9	4	¹ 6 8	¹ 2 3 6 7 9	¹ 2 6 7 9	³ 7 9	5	¹ 2 6 8	¹ 6 8 9
6	2	¹ 3 6 9	7	8	5	³ 9	¹ 6 9	4	¹ 6 9
7	4	5	3	¹ 6 8	¹ 6 8	2	¹ 6 8	9	7
8	7	2	¹ 6 8	4	9	5	3	¹ 6 8	¹ 6 8
9	¹ 6 8	¹ 6 8	9	¹ 6 7	3	⁷ 8	2	5	4

Again we can scratch the spectator numbers. Can you see that after this scratching there is another hidden set of three?

Of course hidden sets are harder to see than regular sets. Hence we consider the following hierarchy, going from easy to difficult: Set of two, set of three, hidden set of two, hidden set of three, set of four, set of five. Together they cover all possibilities for sets. Assume there would be a hidden set of four. Then the other not-yet-fixed cells in that row/column/block would form a set of at most five. And if there is a set of six, the other cells in that row/column/block would form a hidden set of at most three.

Finally some practice material:

	A	B	C	D	E	F	G	H	I
1	9		3		8			5	
2			6					4	
3		7			5	4	2		
4		8	7						1
5					1				
6			4			3	9		
7					7				
8				9					6
9				6		1			3

	A	B	C	D	E	F	G	H	I
1	7			6		5	9		1
2				4					
3				2				7	4
4					1		6		
5		7		8					2
6	4	3						1	
7	9							8	6
8	5		3	7					
9	1								

9 The X-wings configuration

Imagine the following situation:

	A	B	C	D	E	F	G	H	I
1	9	6	4	^{2 3} _{5 8}	^{2 3}	^{2 X} _{5 8}	1	7	^{5 3}
2	5	7	^{2 3}	1	6	4	_{8 9}	^{2 3}	_{8 9}
3	^{2 3}	8	1	7	9	^{5 3}	² ₅	6	4
4	7	^{2 3}	8	^{2 3} _{6 9}	^{1 2 3} ₁	6	4	^{2 3} ₅	^{2 3} _{5 9}
5	1	4	9	^{2 3}	5	7	6	8	^{2 3}
6	^{2 3}	5	6	4	8	^{2 3} ₉	² ₉	1	7
7	6	9	7	² _{5 8}	4	² _{5 8}	3	² ₅	1
8	4	^{2 3}	5	³ _{6 7}	^{1 3} ₁	6	_{7 8}	9	₈
9	8	1	^{2 3}	² _{5 9}	³ ₇	² _{5 9}	⁵ ₇	4	6

We have two rows in which the 3 is allowed only in two positions. These two positions happen to be in the same columns A and F. What can we say about them: If in the third row the 3 is in the A column, in the sixth row the 3 must be in the F column and if the 3 in the third row is in the F column, the 3 in the sixth row must be in the A column. Either way

we end up with a 3 in both the A and the F columns. This means that other possibilities of the number 3 in the A and F columns can be eliminated as is the case with the crossed out 3 in position 1F. This configuration is called X-wings.

The same can be done of course when we have two columns each with two possibilities for a number and these possibilities share the same two rows. Then extra possibilities on those two rows can be eliminated.

It becomes more confusing when we have two blocks each with two possibilities for a number and they share either the same two rows or the same two columns. Again extra possibilities on those two rows or columns can be eliminated as shown:

	A	B	C	D	E	F	G	H	I
1	4 <small>¹_{7 9}</small>	<small>⁶_{7 9}</small> 2	<small>^{5 6}_{8 8}</small> 3	<small>^{5 6}_{8 8}</small> 3	<small>¹₉</small>	<small>¹₉</small>	<small>⁶_{7 8 9}</small>		
2	<small>¹₆</small>	<small>¹₆</small> 8	9	2	7	3	5	4	
3	5 <small>⁷₉</small>	<small>⁶_{7 9}</small> 3	<small>^{4 6}_{8 8}</small> 1	<small>^{4 6}_{8 8}</small> 1	<small>²₉</small>	<small>²₉</small>	<small>²₉</small>	<small>⁶_{7 8 9}</small>	
4	<small>⁷₉</small>	8 <small>^{4 5}_{7 9}</small>	3	1	2	6 <small>⁴_{7 9}</small>	<small>⁵_{7 9}</small>		
5	<small>⁷₉</small>	<small>^{4 5}_{7 9}</small> 1	<small>⁴₈</small> 6	<small>⁴₈</small> 6	6 <small>²_{4 5 9}</small>	<small>²_{4 5 9}</small>	<small>²_{4 5 9}</small>	3	
6	3	2	6	7 <small>^{4 5}₉</small>	<small>^{4 5}₉</small> 8	8	<small>⁴₉</small>	1	
7	<small>^{1 2}_{6 9}</small>	3 <small>^{4 5}₉</small>	<small>^{1 2}_{4 5 6}</small> 7	<small>^{4 5}₉</small> 7	<small>^{1 2}_{4 5 9}</small>	<small>^{1 2}_{4 5 9}</small>	8	<small>²_{5 9}</small>	
8	8 <small>¹_{4 5 6}</small>	<small>^{4 5}₉</small>	<small>^{1 2}_{4 5 6}</small>	<small>^{4 5 6}₉</small>	<small>^{4 5}₉</small>	7	3 <small>²_{5 9}</small>		
9	<small>^{1 2}_{4 5 9}</small>	<small>¹_{4 5}</small>	<small>^{4 5}_{7 9}</small>	<small>^{1 2}_{4 5}</small>	3	8	<small>^{1 2}_{4 5 9}</small>	<small>^{1 2}_{4 5 9}</small>	6

The 5 here occurs in the two blocks 4 and 6 only twice in the rows 4 and 5. Hence we can eliminate the possible 5's in block 5 in the rows 4 and 5. What we may also notice however is that the technique of claiming could have done the job as well: the only occurrences in row 6 of possible 5's are in block 5 and hence other occurrences of possible 5's in that block can be eliminated. Because claiming is considered an easier technique than X-wings, in practice we do not need this variety of the X-wings. On the other hand, as you see these eliminations first by the X-wings method, there is nothing wrong with it.

Something to practice with:

	A	B	C	D	E	F	G	H	I
1				8		1	3		
2			7	5			4		
3		5				3	7		6
4		1	6						
5		8							
6			2		4				
7						6	5		1
8	7							8	
9	2				5			7	

10 Uniqueness

This is a controversial technique. It is however not very difficult to apply.

A good sudoku should have only a single solution. Very often the maker tells us already that the sudoku has one and only one solution. In that case we can of course use this information. Why throw it away? There are however people who do not want to use this information because at the same time that they solve the sudoku, they want to prove that there is only one solution. In our eyes this only makes sense if the collection includes also some sudokus that have more than one solution so that these people are doing something meaningful. This we do not like, and hence we guarantee that all our sudokus have only one solution and at times you will need this information to solve the sudoku. Consider it part of the rules. Of course we need an example.

	A	B	C	D	E	F	G	H	I
1	6	8	3	9	^{1 2}	^{1 2}	4	5	7
2	2	4	1	5	_{7 8}	_{7 8}	9	6	3
3	5	7	9	3	6	4	1	8	2
4	1	6	⁴ ₈	⁴ ₈	5	3	2	7	9
5	9	3	2	¹ ₇	¹ ₇	6	5	4	8
6	7	5	⁴ ₈	² ₈	² ₈	9	3	1	6
7	3	9	6	¹ _{4 8}	¹ _{4 8}	¹ ₈	7	2	5
8	8	1	5	² ₇	3	² ₇	6	9	4
9	4	2	7	6	9	5	8	3	1

Let us have a good look at the four colored cells 4C, 4D, 6C, 6D. Three of them have as only possibilities the 4 and the 8 left and the one in 6D has the 2, the 4 and the 8 left. Assume now that the cell in 6D gets a 4. in that case 4D and 6C become an 8 and 4C becomes also a 4. But if this is the solution then also the configuration in which 4D and 6C are a 4 and 4C and 6D are an 8 is a solution. There is no way to fix which of the two is preferred. This would mean that there is more than one solution. But we were told that this is not the case. The only way out is that 6D can neither be a 4 nor an 8. Hence it must be the 2.

In general: when we have a square pattern with three cells the possibilities a and b and the fourth cell the possibilities a,b and others, and the cells are divided over two blocks, we can scratch the possibilities a and b in the fourth cell.

There are very many variations on this principle of uniqueness. Currently we have used only five varieties of which you already saw the first which we call uniqueness type 1. We will illustrate the others.

	A	B	C	D	E	F	G	H	I
1	8	3	6	4	[×] ₇	5	9	2	¹ ₇
2	7	4	5	¹ _{6 9}	¹ _{6 9}	2	_{8 6}	3	[×] ₈
3	9	1	2	_{7 3 6}	8	_{3 6}	4	_{5 6 7}	5
4	6	8	7	5	2	4	1	9	3
5	4	5	3	⁶ ₉	⁶ ₉	1	7	8	2
6	1	2	9	_{7 3}	_{7 3}	8	5	4	6
7	2	6	4	8	5	7	3	1	9
8	_{5 3}	7	8	_{1 3 6}	_{1 3 6}	9	2	_{5 6}	4
9	_{5 3}	9	1	2	4	_{3 6}	_{6 8}	7	_{5 8}

This variety we call uniqueness 1a. We see again four cells of interest but now the two in one block have as possibilities 6 and 9 and the other two have an extra 1 as possibility. We can say now that not both those cells 2D and 2E can be either a 6 or a 9 because then there would not be a single solution. Hence one of those cells, we do not know yet which one,

must be a 1. In either case there will be a 1 on row 2. Hence other possible 1's on that row can be eliminated as is the case with the 1 in 2I. But also other 1's in the same block can be eliminated. Hence also the 1 in 1E may be crossed out.

The next type we call uniqueness 1b. It looks a bit like type 1a but as you can see it is a little bit different in that the two cells with three possibilities are in different blocks:

	A	B	C	D	E	F	G	H	I
1	4	3	_{7 8}	6	9	1	5	² _{7 × 7 8}	² _{7 8}
2	6	5	2	8	7	4	3	9	1
3	9	1	_{7 8}	3	2	5	₇	⁶ _{7 8}	⁶ _{7 8} 4
4	_{7 8}	4	3	1	5	2	₇	⁶ _{7 8}	⁶ _{7 8} 9
5	² ₈	9	1	7	4	6	² ₈	5	3
6	² ₇	6	5	9	8	3	1	4	² ₇
7	5	_{7 8}	6	2	1	9	4	3	_{7 8}
8	1	² ₇	4	5	3	8	9	² ₇	6
9	3	² ₈	9	4	6	7	² ₈	1	5

Now we can only eliminate the 8's in column H, not in any of the participating blocks. Yet it is something and at times it is more than enough to solve the sudoku.

The next type we call type 2. It involves a longer chain:

	A	B	C	D	E	F	G	H	I
1	₇ ⁵	1	6	8	2	9	3	₇ ⁵	4
2	4	9	3	1	5	7	8	6	2
3	_{7 8} ⁵	₇ ² ₅	² _{7 8}	4	3	6	9	1	₇ ⁵
4	9	[×] ₇	² ₇	6	⁴ ₈	1	5	² ₈	3
5	3	8	5	9	7	2	6	4	1
6	6	² ₄	1	5	⁴ ₈	3	7	² ₈	9
7	1	6	4	7	9	5	2	3	8
8	2	₇ ⁵	9	3	1	8	4	₇ ⁵	6
9	_{7 8} ⁵	3	_{7 8}	2	6	4	1	9	₇ ⁵

This is like type 1 but it has two more elements. Let us have a look at cell 4B. If we put a 2 there, cell 6B gets a 4. This will determine the numbers in the cells 6E, 4E, 4H and 6H.

Let us classify this solution as $\begin{matrix} 2 & 4 & 6 \\ 4 & 6 & 2 \end{matrix}$ But then also $\begin{matrix} 4 & 6 & 2 \\ 2 & 4 & 6 \end{matrix}$ must be a solution. The only way out is to scratch the possible 2 and 4 in cell 4B.

These chains can also 'go around the corner':

	A	B	C	D	E	F	G	H	I
1	9	3	² ₆	7	² ₆	8	5	1	4
2	7	⁴ ₈	⁴ ₈	5	1	9	2	3	6
3	5	² ₆	1	3	4	² ₆	9	7	8
4	3	1	² _{5 6}	8	² _{5 6}	² ₆	⁴ ₇	⁴ _{2 6}	9
5	8	² ₆	9	4	² ₆	3	⁶ ₇	5	1
6	4	7	² _{5 6}	9	² _{5 6}	1	⁶ ₈	² ₆	3
7	1	⁴ ₈	3	2	9	5	⁴ ₈	⁶ ₆	7
8	6	5	7	1	8	4	3	9	2
9	2	9	⁴ ₈	6	3	7	1	⁴ ₈	5

This one we call type 2A.

It should be clear now that one might make many patterns like this. For instance in the 2A pattern, one could have the extra possibilities in the block that is in the middle of the pattern (block 7). One can use a crossbreed of type 2 or 2A with the types 1a or type 1b. One can make the chains longer. And there are even other possibilities. Currently we have not included those, because there is no good indication where to stop. We may include some more in the future.

The following sudoku is for practicing:

	A	B	C	D	E	F	G	H	I
1	9				6				
2			5				8		
3	8		1	4			7		
4			4	5		3			
5				8	9	7			
6		8							3
7	1							9	2
8	5	4				9			
9				6			1		

It should be noticed that this sudoku involves some simpler techniques as well. Out of about 10 billion sudokus we found only two that were like this one, but the other involves techniques we have not discussed yet.

Sometimes we encounter an **incomplete pattern**. Have a look at the next position:

	A	B	C	D	E	F	G	H	I
1	3	8	7 9	7 9	6	4	5	2	1
2	4 5	¹ 5	¹ 4 5	3	8	2	6	7	9
3	6	2	7 9	5	7 9	1	3	8	4
4	4 5	¹ 5	¹ 4 5	4 6	2	8	7	5 6	3
5	7	3	8	¹ 6 9	¹ 5	5 9	4	6 9	2
6	2	6	4 5	4 7 9	7 9	3	8 9	1	5 8
7	8	5 9	3	¹ 2	¹ 5	7	² 9	4	6
8	1	7	6	² 9	4	5 9	² 8	3	5 8
9	5 9	4	2	8	3	6	1	5 9	7

We see here almost the pattern for type 2A. In cell 6D however we miss the possibility for the number 9 (an XY-wing centered at cell 8G was responsible for it). This must have been eliminated at an earlier stage. Yet it is virtually still there because if we give cell 6D the number 7, then 6E and 1D must become 9 and hence all possible 9's in row 6, column D and block 5 (the center block) will be eliminated. But then putting a 9 in cell 6D would also lead to a solution and hence we can cancel the possible 7 in 6D. These incomplete patterns hold also for the types 1 and 2.

11 The swordfish configuration and the Jellyfish

Whereas the X-wings configuration involves two rows/columns with two possibilities that together occupy two columns/rows, the swordfish involves three rows/columns each with at most three possibilities that together occupy three columns/rows. Let us have a look at this as a picture is worth a thousand words:

	A	B	C	D	E	F	G	H	I
1	7	² 5 6	² 5 8	1	4	6 9	³ 5 6	6 8 9	² 3 6
2	¹ 5 6	3	¹ 5	2	8	7 9	5 6	7 9	4
3	4	9	² 8	5	3	7	1	7 8	² 6
4	6 9	4 7	6	3	4 7 9	2	8	4 7 9	1
5	8 9	² 1	² 7 8 9	4 9	6	5	4 8 9	3	7 9
6	5 6	4 5 6	5 8 9	3	7 9	1	2	4 6	7 9
7	3	7 8	6	7 8 9	5	4	7 9	2	1
8	¹ 5 8 9	5 8	¹ 7 8 9	6 8 9	7 9	2	4 6	4 6	7 9
9	² 9	² 7	4	6 7 9	1	3	6 7 9	5	8

In the rows 4, 7 and 9 the possibility of a 7 occurs exactly three times and in all cases in the columns B, D and G. Clearly the number 7 has to occur in all three rows and since the numbers cannot share a column these three columns all get a number 7 originating in one of those three rows. That means that other potential 7's in those columns can be scratched. We notice that this eliminates many potential 7's (to be precise: seven). This is a very sympathetic property of swordfish configurations when they occur early in the puzzle: they cause great progress.

Originally the name swordfish configuration was given to three rows/columns with each two possibilities connected (sharing columns/rows) in a cyclic way as in the following example:

	A	B	C	D	E	F	G	H	I
1	7	9	4	1 ₈	2 ₃	6	1 ₃	5	1 _{2 3} 8
2	5	2 ₃	1 ₈	1 ₈	7	4	6 ₉	3 ₉	2 ₃ 6
3	1 ₈	2 ₃	6	5	2 ₃	3 ₉	1 ₄ 7	1 ₄ 7 8	1 ₄ 7 X
4	1 ₄ 9	1 ₄ 6	2	3	8	5	6 ₄ 7	1 ₄ 9	1 ₄ 6
5	3	1 ₆	5	7 ₉	4	7 ₉	8	2	1 ₆
6	4 _{8 9}	4 _{7 8}	7 X	2	6	1	5	4 ₃ 7	4 ₃ 7
7	1 ₄	1 ₄ 7	3	6	5	8	2	1 ₄ 7	9
8	6	4 _{7 8}	7 X 9	7 ₉	1	2	4 ₇	3 ₄ 7 8	5
9	2	5	1 _{7 8 9}	4	3 _{9 7}	3 _{9 7}	1 _{9 7}	6	1 _{7 8}

It was however recognized soon that this could be generalized. The first example is actually reasonably rare in realistic sudokus. One usually finds one or more possibilities missing as in the cyclic case or the next two examples:

	A	B	C	D	E	F	G	H	I
1	2 ₃ 6	4	6 _{8 9}	3 _{6 7 9}	1	2 _{5 6} X	5 ₃	3 _{7 8 9}	X _{5 9}
2	5	7	1	8	4 ₉	3 ₄ 3	6	2	4 ₃ 9
3	2 ₃ 6	2	6 _{8 9}	3 _{6 7 9}	2 _{4 5 6} X	2 _{4 5 6} X	1	3 _{7 8 9}	X _{4 5 9}
4	8	1	4 ₆	3 _{6 7}	2 _{4 7} X	9	5 ₃	3 ₇	2 ₅ X
5	2 ₆	3	5	1 ₆	8	1 ₂ 6	9	4	1 ₂
6	2 ₇	2 ₉	4 ₉	5	2 ₄ 7	3 _{1 2 3} 7	8	6	1 _{2 3} 7
7	4	6	3	1 _{7 9}	7 ₉	1 ₇	2	5	8
8	1	5	7	2	6	8	4	3 ₉	X ₉
9	9	8	2	4	5 ₃	5 ₃	7	1	6

	A	B	C	D	E	F	G	H	I
1	8	2	4	3	6	¹ 5	¹ 5 ₉	7	¹ 5 ₉
2	6	7	5	¹ 2	8	9	3	² 4	¹ 2 ₄
3	1	9	3	² 5	4	7	² 5 ₈	6	² 5 ₈
4	⁵ 9	3	6	¹ 5 ₉	7	¹ 2 ₄ 5	² 4 ₅ 8 _X	² 4 ₈ 9	² 4 ₅ 8 _X
5	⁵ 9	1	2	8	3	⁴ 5	6	⁴ 9	7
6	7	4	8	6	⁵ 9	² 5	² 5 ₉	1	3
7	4	⁵ 8	1	7	² 5 ₉	6	² 8 ₉	3	² 8 ₉
8	3	6	9	4	¹ 2	8	7	5	¹ 2
9	2	⁵ 8	7	⁵ 9	¹ 5 _X	3	¹ 4 ₈ X	⁴ 8 ₉	6

One has to learn how to hunt for the swordfish configuration. This requires some practice. Here is one to try out:

	A	B	C	D	E	F	G	H	I
1		8				9			1
2	3				5			6	
3	5			8			9		
4			8		4				6
5				3		8			2
6		2					3		
7				1			2		
8		6				7			3
9	1								7

We generalized the X-wings configuration to the 3x3 swordfish. Of course we can continue and go to a 4x4 configuration. This is called the **jellyfish**. We mentioned already that a complete swordfish is a bit rare. This is even more so for a complete jellyfish. Actually the jellyfish itself is reasonably rare among randomly generated sudokus, but because its degree of difficulty is much higher than the swordfish it becomes rather frequent among the most difficult sudokus. Here is an example:

	A	B	C	D	E	F	G	H	I
1	^{1 3} 3	^{1 4 3} 4	6	^{4 5 3} 5	^{4 5 3} 5	2	^{4 5 3} 4	^{1 4 5 3} 4	^{1 4 5 3} 4
2	³ 7	^{4 3} 4	2	1	^{4 5 3} 4	8	9	6	^{4 5 3} 4
3	^{1 3} 8	5	^{4 8 9} 4	^{4 6 4} 6	^{3 3} 3	6	2	7	^{1 4 3} 4
4	³ 8	6	5	^{4 4} 4	^{1 2 3 1 3} 4	^{3 3} 3	^{4 3} 4	^{1 2 3 1 3} 4	^{1 4 3} 4
5	4	³ 7	1	^{7 9 7 9} 7	^{2 3} 2	5	8	^{2 3} 2	6
6	2	9	^{7 8} 7	^{4 6 4} 4	^{3 1 3 1 3} 3	^{1 3 1 3} 1	^{4 5 3} 4	^{1 4 5 3} 4	^{1 4 5 3} 4
7	^{1 5 7 8} 5	^{1 4 7 8} 4	3	^{5 7} 5	^{1 5 7} 1	9	6	^{4 5 8} 4	2
8	^{1 5 9} 5	2	^{4 7 9} 4	8	6	^{1 3 7} 1	^{4 5 3 7} 4	^{4 5 3 7} 4	^{4 3 7 9} 4
9	6	⁸ 8	^{7 8 9} 7	2	^{5 3} 5	4	1	^{5 3 8 9 7 8 9} 5	^{3 3} 3

Once you have understood the swordfish the jellyfish should not cause any problems.

And again one sudoku for practicing. This one involves a few other of the simpler techniques as well.

	A	B	C	D	E	F	G	H	I
1						5			1
2	5		4		3	2			
3				9		6			
4	7	8							3
5							2	6	
6				3	8				
7			8					9	
8	4						6	5	
9	6			7					

The 5x5 generalization is called the squirmbag. We have not used it. There is a good reason for this. If one would have five rows that form a squirmbag, there will be two, three or four columns that together form an X-wings configuration, a swordfish or a jellyfish. There is a certain complementarity. Hence the squirmbag is not really needed.

12 The finned X-wings configuration

As the name says, the finned X-wings configuration is an X-wings configuration with a little extra. This can be explained best with a diagram:

	A	B	C	D	E	F	G	H	I	
1	1	6	⁴ ₉	³ _{4 5}	³ ₄	³ ₉	2	8	7	³ ₅
2	7	5	⁴ ₃	1	8	6	⁴ ₃	2	9	
3	2	8	⁴ ₉	7	⁴ ₉	³ _{4 5}	³ _{4 5}	1	6	
4	8	9	1	6	7	³ _×	2	4	³ ₅	
5	3	4	5	8	2	9	1	6	7	
6	6	7	2	³ _{4 5}	1	³ _{4 5}	³ ₅	9	8	
7	4	2	8	9	5	7	6	3	1	
8	5	3	7	2	6	1	9	8	4	
9	9	1	6	³ ₄	³ ₄	8	7	5	2	

We see that one of the two rows that define the X-wings has actually three possible 5's in it. The one at 6D is extra. If this is in the same block as one of the other possible 5's in the row something can still be done. Note that if the 5 in row six is at 6G everything goes fine because the other must be at 3F. This makes all other possible 5's in the F column impossible. The same when 6F is a 5. When 6D is the 5 however things are different: now all possible 5's in the block (block 5) can be eliminated. Hence in all cases all extra possible 5's that are both inside block 5 and column F can be eliminated as is done with the possible 5 in 4F.

Of course the principle holds when we exchange rows and columns.

The pratise sudoku was unique in 240000000 generated sudokus:

	A	B	C	D	E	F	G	H	I
1			3	6		8	7		1
2		1			9			3	
3							6		
4	5	3			4				
5			1	2					
6			8				4	5	3
7					8				6
8			6	3				7	
9		2		4			8		

13 The XY-wings configuration

The XY-wings configuration is formed by three cells, each with two possibilities. Together they have three different values as in the example:

	A	B	C	D	E	F	G	H	I
1	4	5	6	8	2	3	9	1	7
2	3	1	8	4	9	7	5	6	2
3	9	2	7	1	6	5	3	4	8
4	5	4	³ ₉	⁶ ₇	³ ₂	_{7 8}	_{8 9}		1
5	8	7	2	5	1	9	4	3	6
6	1	6	³ ₉	³ ₇	8	4	² ₇	² ₉	5
7	2	8	5	9	4	1	6	7	3
8	6	3	4	² ₇	⁵ ₇	8	1	² ₅	9
9	7	9	1	^{2 3} ₅	³ ₅	6	[×] ₈	² ₅ ² ₈	4

The center cell is 6D with possibilities 3 and 7. The wings are the cells 9D and 6G. They are in the same column or row respectively as the center cell. They share one possibility

with the cell 6D. These must be different possibilities. And in addition they share a third possibility with each other which is 2 in this case.

When the center cell has the value 3, the cell 9D must have the value 2 and when the center cell has the value 7 the cell 6G must have the value 2. This means that in either case the cell 9G cannot have the value 2. Hence we can scratch this possibility.

There is a variety to this configuration in which one of the wings is in the same block as the center cell:

	A	B	C	D	E	F	G	H	I
1	4	3	² ₉	1	6	5	7	² ₉	8
2	_{8 9}	⁵ _{8 9}	6	2	4	7	³ ₅	³ ₉	1
3	7	² ₅	1	8	9	3	4	² ₆	^{5 6}
4	5	6	4	3	2	1	8	7	9
5	2	1	7	4	8	9	³ _{5 6}	³ ₆	³ _{5 6}
6	³ _{8 9}	_{8 9}	³ _{8 9}	5	7	6	1	4	2
7	6	² ₈	5	7	3	² ₈	9	1	4
8	³ _{8 9}	4	^{2 3} _{8 9}	6	1	² ₈	^{2 X} ₆	5	7
9	1	7	^{2 3}	9	5	4	^{2 X} ₆	8	³ ₆

In this case the center cell is 3I. Notice now that because the cell in 2G shares the block with the center cell, its column passes through the block of the other wing in 9I. The consequence is that we can eliminate all possibilities of the number 3 that are both in the column G and the block 9 (right bottom). Usually that will be just a single possibility anyway, but sometimes, as is the case here, the harvest is bigger.

And now the usual example:

	A	B	C	D	E	F	G	H	I
1	5	1			4	7		2	
2	3							9	1
3									
4				6	1			5	2
5						4		8	
6			4	7	5	3			
7	1								
8		2					6	1	
9					9				

14 Remote Pairs

Imagine we have a number of cells all with the same pair of possibilities, and imagine that they are all coupled in a way that if we select the number that goes in the first cell the numbers in the other cells are fixed. As in the example:

	A	B	C	D	E	F	G	H	I
1	9	1	8	2	4	5	³ ₇	³ ₇	³ ₆
2	5	2	7	3	8	6	4	1	9
3	4	6	3	¹ ₇	¹ _{7 9}	¹ _{7 9}	5	2	8
4	³ ₈	^{4 5} ₈	2	9	6	¹ _{4 7 8}	³ _{7 8}	³ _{4 5 7}	^{1 3} _{4 5}
5	³ ₈	^{4 5 9} ₈	1	⁴ ₇	2	⁴ _{7 8}	³ _{7 8 9}	6	^{4 5 3} _{4 5}
6	6	7	⁴ ₉	5	3	¹ ₈	² ₈	⁴ ₉	^{1 2} _{1 2}
7	7	8	5	¹ ₄	¹ ₉	^{2 3} ₉	^{2 3} _{6 9}	³ _{4 9}	^{2 3} _{4 6}
8	2	3	⁴ ₉	6	⁵ _{7 9}	⁴ _{7 9}	1	8	^{4 5} _{4 5}
9	1	⁴ ₉	6	8	⁵ ₉	^{2 3} ₉	^{2 3} ₉	³ ₅	³ ₇

If we put a 4 in cell 9B, we get a 9 in cell 8C, a 4 in cell 6C and a 9 in cell 6H. In that case the position 9H shares the row with the 4 in 9B and the 9 in cell 6H. If we start with the 9

in 9B we end up with the 4 in 6H and hence again cell 9H cannot have a 4 or a 9. Hence we can eliminate those possibilities. We say that the distance between 9B and 6H is three in the chain 9B, 8C, 6C, 6H. If a cell shares a row with one element of a chain and a column with another element of the same chain and these elements have a distance in the chain that is odd, we can eliminate the numbers of the possibilities in the chain in that cell. Another example:

	A	B	C	D	E	F	G	H	I
1	6	3	1	2	4 5	7	8	4 5	9
2	2	7	8	6	4 5	9	4 5	1	3
3	4	9	5	8	1	3	7	6	2
4	_{7 8} 1	_{4 7} 4	3	2	6	9	_{4 5 7 8} 4 5	4 5	
5	_{7 5} 2	6	4 5	9	8	3	_{4 7} 4	1	
6	3	_{4 5 8} 4 5	9	1	7	4 5	2	₈ × 8	6
7	_{7 5 8} 4 5	_{4 5 8} 3	9	6	1	4 5	2	_{7 8} 7 8	
8	1	_{4 5 8} 4	_{4 7} 4 5	3	2	6	9	_{7 8} 7 8	
9	9	6	2	7	8	4 5	1	3	4 5

Here we could consider the chain as the cells 2E,1E,1H,2G,7G,9I,9F,6F,5D, 8D. In that case the distance between the cells 1H and 6F is five and we can eliminate the potential 4 in cell 6H. Alternatively we could write the chain as the cells 2E,1E,1H,2G,7G,9I,9F,8D,5D,6F. In that case the distance between the cells 1H and 6F is seven. Still odd. In complicated patterns the distance is not always unique but either it is always even or it is always odd.

The remote pairs technique occurs mostly near the end of the difficult part of the sudoku. This is because it requires lots of other steps first to create so many cells with only two possibilities. When most cells that are left have few possibilities the scratching of a few possibilities often leads to a quick resolution of the puzzle.

And now for practicing:

	A	B	C	D	E	F	G	H	I
1							5	8	
2					3			4	9
3				6		5			
4	4						2		
5			6		2		4		
6		9				8			
7		6	5			9			
8			3			2	6		1
9	2							3	

15 The XYZ-wings configuration

In this configuration we need a center cell with three possibilities and two wings, each with two possibilities which they have in common with the center cell. The wings should not have both the same possibilities. One of the wings must be in the same block as the center cell and the other must be outside the center cell on either the same row or in the same column as the center cell. It cannot be in the same row/column as the other wing. What does this mean:

	A	B	C	D	E	F	G	H	I
1	8	5	3	9	2	7	6	4	1
2	9	7	1	4	6	8	5	2	3
3	6	2	4	1	3	5	7	8	9
4	7	3	5	2	9	4	8	1	6
5	4	9	6	³ ₇	8	1	^{2 3} ₇	² ₅	² ₅
6	1	8	2	³ ₇	5	6	^{4 3} ₇	9	⁴ _X
7	2	4	7	⁶ ₈	1	3	9	^{5 6} ₈	⁵ ₈
8	5	¹ ₆	9	⁶ ₈	7	2	¹ ₄	3	⁴ ₈
9	3	¹ ₆	8	5	4	9	^{1 2} ₇	⁶ ₇	² ₇

The center is in 5I and has the possibilities (2,5,7). The wing inside the block at 5H has the possibilities (5,7) and the wing in the same column at 9I has (2,7). Let us look at the cell at 9I. If it takes the value 2 the cell in 5I cannot have the value 2 and hence the cells 5H and 5I form a set of two and therefore the other 5's and 7's in the block can be scratched. If the cell in 9I takes the value 7, other positions in column I can no longer be 7. This means that in cell 6I the 7 will always be impossible and can be erased.

There is no need for the wing that is in the same block as the center cell to be in the same line or column as the center cell. This is shown in the following example:

	A	B	C	D	E	F	G	H	I
1	$\begin{matrix} 6 \\ 7\ 8 \end{matrix}$	$\begin{matrix} 1 \\ 7\ 8 \end{matrix}$	$\begin{matrix} 1 \\ 7\ 8 \end{matrix}$	3	9	2	$\begin{matrix} 1 \\ 7 \end{matrix}$	5	4
2	4	$\begin{matrix} 1 \\ 7 \end{matrix}$	2	5	8	$\begin{matrix} 6 \\ 7 \end{matrix}$	$\begin{matrix} 1 \\ 7\ 9 \end{matrix}$	3	$\begin{matrix} 6 \\ 7\ 9 \end{matrix}$
3	9	3	5	4	$\begin{matrix} 6 \\ 7 \end{matrix}$	1	8	2	$\begin{matrix} 6 \\ 7 \end{matrix}$
4	2	$\begin{matrix} 7\ 8\ 9 \\ 7\ 8 \end{matrix}$	$\begin{matrix} 6 \\ 7\ 8 \end{matrix}$	$\begin{matrix} 6 \\ 7 \end{matrix}$	4	3	$\begin{matrix} 7 \\ 9 \end{matrix}$	1	5
5	3	5	$\begin{matrix} 1 \\ \times \end{matrix}$	9	$\begin{matrix} 1 \\ 7 \end{matrix}$	8	4	6	2
6	$\begin{matrix} 6 \\ 7 \end{matrix}$	$\begin{matrix} 1 \\ 7\ 9 \end{matrix}$	4	2	$\begin{matrix} 1 \\ 7\ 6 \end{matrix}$	5	3	8	$\begin{matrix} 7 \\ 9 \end{matrix}$
7	$\begin{matrix} 7\ 8 \end{matrix}$	6	$\begin{matrix} 7\ 8 \end{matrix}$	1	2	9	5	4	3
8	5	2	9	8	3	4	6	7	1
9	1	4	3	$\begin{matrix} 6 \\ 7 \end{matrix}$	5	$\begin{matrix} 6 \\ 7 \end{matrix}$	2	9	8

If the cell in 7C takes the value 7 the 7 in 5C disappears and when it takes the value 8 there is the set of two (6,7) in the block and hence the 7 in 5C still disappears.

This is the sudoku for practicing:

	A	B	C	D	E	F	G	H	I
1		6			7		3		
2		7				5			
3	9	8		6					
4			6	3		8			1
5	5		1		2		6		
6		3							
7				2		1			
8				7	9	3	1	2	5
9								6	3

16 Almost Locked Candidates

The almost locked candidates is a rather nice technique which does not require very much. The best is if we look at the example first:

	A	B	C	D	E	F	G	H	I
1	9	6	3	7	¹ / ₄	¹ / _{4 5}	2	8	¹ / ₅
2	8	1	2	^{5 6}	³ / _{6 9}	^{5 3} / _{7 9}	³ / _{5 9}	4	^{5 3} / _{7 9}
3	4	5	7	2	^{1 3} / ₉	8	^{1 3} / ₉	¹ / ₉	6
4	3	8	9	1	5	6	4	7	2
5	1	2	6	4	8	7	^{5 9}	3	^{5 9}
6	5	7	4	3	2	9	¹ / ₆	¹ / ₆	8
7	2	9	^{5 8} / ₈	^{5 6} / ₈	7	^{1 3} / ₈	^{1 3} / _{6 8}	^{1 5 6} / ₈	4
8	6	^{4 3} / ₈	1	^{5 8} / ₈	^{4 3} / ₈	2	^{7 8 9} / ₈	^{5 7 9} / ₈	
9	7	^{4 3} / ₈	^{5 8} / ₈	9	^{1 6 4 5} / ₈	^{1 3} / _{6 8}	^{1 3} / _{6 8}	2	^{1 3} / _{6 8}

We see the main cell at 9I with two possibilities 1 and 3. The second cell has to be outside the same block not be in the same row or column and have at least the same two possibilities. The row or the column of the second cell has to intersect the block of the main cell. The

final requirement is that in the row of the second cell there is no other occurrence of either 1 or 3 outside the block of the main cell. You can see that this is the case in row 7. Now let us look what happens. The main cell is either a 1 or a 3. Assume it is a 1. In that case there can be no other 1 in the block and the only possible 1 in row 7 left is in our second cell. Something similar holds for if we choose the 3 in the main cell. Hence we see that the second cell can only have the values 1 or 3. Next we see that if the main cell is 1, the second cell is 1 and hence the 3 in row 7 must be inside the block of the main cell. That means that neither the 1, nor the 3 can occur in other cells in the block. Similarly, if we start with the 3 the other cells in the block can be neither a 1 or a 3. Hence the locations inside the block of the main cell that are neither the main cell nor in the same row as the second cell can have neither a 1 nor a 3. Hence we scratch those numbers in the cell 9G.

The next example has again the main cell in a block (cell 7I in block 9) and this time it is the column that is relevant for the second cell (column G). We see that this time some more possibilities are erased inside block 9.

	A	B	C	D	E	F	G	H	I
1	9	7	2	1	6	3	4	5	8
2	4	₈ ⁶	¹ ₈ ⁶	2	5	7	3	¹ ₆	9
3	¹ ₆	5	3	8	9	4	¹ ₆	7	2
4	¹ ₆ ³	4	¹ ₆	5	7	8	² ₉ ²	¹ ₉ ³	
5	5	2	7	9	3	1	8	₄ ⁶ ₄ ⁶	
6	¹ ₈ ³	₈ ³	9	6	4	2	5	¹ ₃	7
7	₈ ² ₈ ³	₈ ³ ₈ ⁶	₈ ⁶	4	¹ ₈ ²	5	7	X ₉ ² X ₉ ³	¹ ₆
8	₈ ² ₈ ³	1	5	7	² ₈	₉ ⁶	² ₉ ⁶ ₉ ⁴	X ₉ ² X ₉ ³	₉ ⁴ X ₉ ³
9	7	₉ ⁶	4	3	¹ ₂	₉ ⁶	¹ ₂	8	5

It is also possible to exchange the role of blocks and rows/columns. In the next example which is following directly the situation of the previous example we have the main cell at 3A in column A and the second cell in block 4 (left center) at 4C. Now we see that the only other occurrences of the numbers 1 and 6 in block 4 are in column A and hence all other occurrences of 1 and 6 in column A can be erased.

	A	B	C	D	E	F	G	H	I
1	9	7	2	1	6	3	4	5	8
2	4	₈ ⁶	¹ ₈ ⁶	2	5	7	3	¹ ₆	9
3	¹ ₆	5	3	8	9	4	¹ ₆	7	2
4	¹ ₆ ³	4	¹ ₆	5	7	8	² ₉ ²	¹ ₉ ³	
5	5	2	7	9	3	1	8	₄ ⁶ ₄ ⁶	
6	¹ ₈ ³	₈ ³	9	6	4	2	5	¹ ₃	7
7	₈ ² ₈ ³	X ₈ ³	₈ ⁶	4	¹ ₈ ²	5	7	₉ ² ₉ ³	¹ ₆
8	₈ ² ₈ ³	X ₈ ³	1	5	7	² ₈	₉ ⁶	₉ ⁶ ₉ ⁴	₉ ⁴ ³
9	7	₉ ⁶	4	3	¹ ₂	₉ ⁶	¹ ₂	8	5

The last example shows that also when the main cell is in a row or a column (the cell 7A) and the second cell is in a block (block 9) we can eliminate extra possibilities inside the second cell.

	A	B	C	D	E	F	G	H	I
1	1 ^{4 6 4 6}			^{5 5} _{8 8}		3	2	9	7
2	9	8	2	6	7 ^{1 4}	^{1 1} _{4 5 4 5}		3	
3	3	7	5	2 ^{1 4}		9	6 ^{1 4}		8
4	4	9	8	3	6 ^{1 2} _{5 5}	^{1 1} _{5 5}	7 ^{1 2} _{5 5}		
5	5 ^{1 2}		7 ^{1 8}		9 ^{1 2} _{8 8}		3	6	4
6	^{2 6} ₆	3 ^{1 6 4 5}		^{1 1} _{4 5 4 5}		7	8 ^{1 2} _{5 5}		9
7	^{2 8} ₈	^{1 X} _{4 5}	9 ^{1 4 5} _X		3	6	7 ^{1 2} _{4 5 4 5}	^{1 2} _{5 5}	
8	7 ^{1 2} _{4 5}		3	9 ^{1 4 5} _{8 8}	^{1 1} _{4 5 4 5}	^{1 1} _{4 5 4 5}	^{1 2} _{4 5 4 5}	^{X 2} _{X X 8}	6
9	^{1 6 4 5 6} ₈	^{1 4 6}		7	2 ^{1 4 5} ₈		9	3 ^{1 5}	

All together this is a nice technique that we found on sudopedia.org.
Now for practicing:

	A	B	C	D	E	F	G	H	I
1	5	1	3						
2	8			6	2				
3	4			8					
4							3	1	
5			9		5		6		
6	3				7			5	
7					4	7			1
8							7	2	6
9			2		1				4

17 The finned swordfish configuration

As with the finned X-wings the finned swordfish is a swordfish configuration with something extra. One of the rows/columns has one cell extra in one of the blocks with the result that we can only eliminate possibilities inside that block.

Let us have a look at the example:

	A	B	C	D	E	F	G	H	I	
1	4 7	6	9	6	3	4 5 6 8	1 6	4 5 4 5	2	4 5 7 8
2	1	4 7	3	4 7	5 8	2	6	5 9	5 8 9	
3	5	2 4 7	2 6 7 8	1 4 7	4 6 8	9	3	1 4 7	4 7 8	
4	4 7	6	8	1 5 6 7	2	4 7	6 3	1 4 5 7	1 4 5 7 9	5 6 9
5	2 4 7	1 2 6 7 9	1 2 6 7 9	5	4 7	6 4 6	4 1 4	8	3	
6	3	4 7	6 5 6 7	9	1	8	2	4 5 7	4 5 6 7	
7	8	5	4	6	2	7	9	3	1	
8	2 6 9	1 2 6 9	1 2 6 9	8	3	1 4	7	4 5	4 5 2	
9	2 7	3	1 2 7	1 4	9	5	8	6	4 2	

There are three columns with three possibilities for the number 4 (A and G) and there is one column with four possibilities for this number (column E). The extra possibility is in cell 3E. The rows affected by the swordfish are the rows 1, 4 and 5. Because the fin is in block 2 (center top) that means that all extra possibilities for number 4 that are both in row 1 and block 2 can be eliminated. Hence we can scratch the 4 in cell 1F.

Again a complete configuration with all 10 cells is rare. Usually one or more cells are missing. This can sometimes be rather confusing as in:

	A	B	C	D	E	F	G	H	I
1	2 3 7 9	6	2 7 9	5	1	2 7	4	3 7 9	8
2	2 3 7 8	3 7	2 5 7 8	9	4	2 6 7	1	5 7	3 6
3	4	1 7 9	1 5 7 9	3	6 7	8	2	5 7 9	6 9
4	1	4	3	7	8	5	9	6	2
5	8 9	2	8 9	6	3	4	5	1	7
6	7 6	5	7 6	1	2	9	3 8	3 8	4
7	2 3 6 7 9	3 7 9	4	2 8	6 7 9	1	3 6 7 8	3 8 9	5
8	6 7 9	8	1 7 9	4	5	3 7	3 6	2	1 3 9
9	5	1 3 7 9	1 2 6 7 9	2 8	6 7 9	3 6 7	3 6 7 8	4	1 3 9

And again one to practice with:

	A	B	C	D	E	F	G	H	I
1				8	9				5
2			2		1			3	
3				7		3	6	9	
4								2	
5		5							
6			1			4			3
7		1			7	8			
8			3				7	5	
9		8					9		

18 The WXYZ-wings configuration

The WXYZ-wings configuration needs four cells. The center cell has three possibilities and the three wings each have two possibilities. The wings share one of their possibilities with the center cell (all three a different one) and their second possibility they share with each other. One or two of the wings are in the same block as the center cell and the other(s) is/are either on the same row or on the same column as the center cell. The three wings cannot all three be in the same row or column, because then we would just have a set of 4. Neither can all four cells be in the same block. Let us look at the example:

	A	B	C	D	E	F	G	H	I
1	^{5 6}	^{8 9}	7	^{5 8}	1	3	4	2	^{5 6 9}
2	^{1 4 5}	^{4 8 9}	^{3 5 8}	2	6	7	^{1 8}	^{1 5 9}	^{3 5 9}
3	^{1 5 6}	^{8 3}	2	^{5 8}	4	9	⁶	^{1 5 3}	7
4	9	5	1	3	2	4	7	6	8
5	8	2	4	1	7	6	3	^{5 9}	^{5 9}
6	7	6	3	9	8	5	2	4	1
7	2	7	9	6	3	1	5	8	4
8	^{4 5}	^{4 8}	^{5 8}	7	9	2	^{1 6}	^{1 3}	^{3 6}
9	3	1	6	4	5	8	9	7	2

The center cell is 3H. The others are the wings. No matter which of the three values the center takes, one of the wings will take the value 8. This means that all other cells on row 3 and inside block 3 (right-top) can have the 8 scratched.

In the second example we have two wings inside the same block as the center cell but the result is the same: the possible 3 in cell 8C gets eliminated.

	A	B	C	D	E	F	G	H	I
1	^{1 3 8}	^{1 6}	2	^{1 4 6}	^{1 4}	^{5 3}	7	^{4 5}	9
2	^{1 7}	^{1 7}	^{1 5 6}	^{1 4 6}	8	9	2	^{4 5}	3
3	^{3 9}	4	^{5 9}	^{3 7}	2	^{5 3 7}	6	1	8
4	^{1 7 9}	5	4	^{1 7}	^{1 9}	2	3	8	6
5	2	^{1 7}	8	5	3	6	^{4 9 7}	^{1 4 7 9}	
6	6	3	^{1 7 9}	^{1 4 7 8}	^{1 4 9 7 8}		5	2	^{1 7}
7	5	^{7 8 9}	^{7 3}	2	6	1	^{4 8 9 7 9}	^{3 4 7}	
8	^{1 7 8}	^{1 6 7 8 9}	^{1 6 7 8}	^{3 8}	5	4	^{1 8 9 7 9}	³	2
9	4	2	^{1 3}	9	7	^{3 1 8}	^{1 8}	6	5

And now for practice:

	A	B	C	D	E	F	G	H	I
1									4
2	8		7		5			2	
3			5	1					
4							5		
5			4	9				8	
6		3		2		8	4	7	
7				3					
8							2		
9	2	6	9		1		7		

19 Coloring

Coloring is a technique that involves some reasoning. Let us take the following board:

	A	B	C	D	E	F	G	H	I
1	8 ₄ ²	₄ ^{1 2}	₄ ^{1 2}	6	9 ₅ ^{1 2}	₇ ²	₄ ²	₇ ²	3
2	9	6	3	4	7 ₅ ²	1	₅ ²	8	
3	5	7 ₄ ^{1 2}	₄ ^{1 2}	_{1 2}	3	8	6	9 ₄ ²	
4	₄ ^{2 3}	8 ₄ ²	5	1	7 ₄ ^{2 3}	6	₄ ²	9	
5	₄ ^{2 3}	1	5	9	8	6 ₄ ^{2 3}	₄ ²	7	
6	6	9	7	3	2	4	8	1	5
7	₄ ²	3	6	8	5	9 ₇ ²	₇ ²	1	
8	1 ₄ ²	9	7	6	3	5	8 ₄ ²		
9	7	5	8 _{1 2}	4 _{1 2}	9	3	6		

We notice that in row 2 the 2 can occur only in two positions (also the 3 but we concentrate on the 2's at the moment). We will call one red and one blue. This gives the following start position:

	A	B	C	D	E	F	G	H	I
1	8 ₄ ²	^{1 2} ₄	6	9	^{1 2} ₅	² _{4 7}	² _{4 5 7}	3	
2	9	6	3	4	7	² ₅	1	² ₅	8
3	5	7	^{1 2} ₄	^{1 2}	3	8	6	9	² ₄
4	^{2 3} ₄	8	² ₄	5	1	7	^{2 3} ₄	6	9
5	^{2 3} ₄	1	5	9	8	6	^{2 3} ₄	² ₄	7
6	6	9	7	3	2	4	8	1	5
7	² ₄	3	6	8	5	9	² _{4 7}	² _{4 7}	1
8	1	² ₄	9	7	6	3	5	8	² ₄
9	7	5	8	^{1 2}	4	^{1 2}	9	3	6

What we will do now is color other two's when we see they must have the same color as one of those two. This until we run into a cell of which the 2 is adjacent to both a red and a blue 2:

	A	B	C	D	E	F	G	H	I
1	8 ₄ ²	^{1 2} ₄	6	9	^{1 2} ₅	² _{4 7}	² _{4 5 7}	3	
2	9	6	3	4	7	² ₅	1	² ₅	8
3	5	7	^{1 2} ₄	^{1 2}	3	8	6	9	² ₄
4	^{2 3} ₄	8	² ₄	5	1	7	^{2 3} ₄	6	9
5	^{2 3} ₄	1	5	9	8	6	^{2 3} ₄	² ₄	7
6	6	9	7	3	2	4	8	1	5
7	² ₄	3	6	8	5	9	² _{4 7}	² _{4 7}	1
8	1	² ₄	9	7	6	3	5	8	² ₄
9	7	5	8	^{1 2}	4	^{1 2}	9	3	6

Note now the possible two in cell 1F. In the red case it gets eliminated and in the blue case it gets eliminated. Hence it will always be eliminated and we can cross it out.

Note that many of the cells we cannot say much about. But that is not needed. We only know that cell 1F will have either a red cell at 1B or a blue cell at 2F.

Sometimes a coloring leads to a contradiction. Take the next coloring:

	A	B	C	D	E	F	G	H	I
1	8 ₄ ²	^{1 2} ₄	6	9 ^{1 5}	^{4 7} ₇	^{4 5} ₇	3		
2	9	6	3	4	7 ^{2 5}	1	^{2 5} ₅	8	
3	5	7	^{1 4} ₄	^{1 2} ₄	3	8	6	9 ^{4 2}	
4	^{4 2 3} ₄	8 ^{4 2}	5	1	7 ^{4 2 3}	6	9		
5	^{4 2 3} ₄	1	5	9	8	6 ^{4 2 3}	^{4 2} ₄	7	
6	6	9	7	3	2	4	8	1	5
7	^{4 2} ₄	3	6	8	5	9 ^{4 2}	^{4 2} ₇	^{4 2} ₇	1
8	1 ^{4 2}	9	7	6	3	5	8 ^{4 2}		
9	7	5	8 ^{1 2}	4 ^{1 2}	9	3	6		

When we work this out we obtain that the red cell in 3I forces the cell in 8I to be blue. This forces the cell in 7A to be blue and this again forces the cell in 4C to be blue. But this is impossible because the cell in 3C is already blue. In addition we can show some more cells that have to be blue and some that have to be red.

	A	B	C	D	E	F	G	H	I
1	8 ₄ ²	^{1 2} ₄	6	9 ^{1 5}	^{4 7} ₇	^{4 5} ₇	3		
2	9	6	3	4	7 ^{2 5}	1	^{2 5} ₅	8	
3	5	7	^{1 4} ₄	^{1 2} ₄	3	8	6	9 ^{4 2}	
4	^{4 2 3} ₄	8 ₄ ²	5	1	7 ^{4 2 3}	6	9		
5	^{4 2 3} ₄	1	5	9	8	6 ^{4 2 3}	^{4 2} ₄	7	
6	6	9	7	3	2	4	8	1	5
7	^{4 2} ₄	3	6	8	5	9 ^{4 2}	^{4 2} ₇	^{4 2} ₇	1
8	1 ₄ ²	9	7	6	3	5	8 ₄ ²		
9	7	5	8 ^{1 2}	4 ^{1 2}	9	3	6		

The important thing is that blue leads to a contradiction and hence blue cannot be the choice. In addition we can scratch the cells in 1G and 1H because they are at the intersection of red and blue. Anyway, since red has to be the choice all other possible 4's in that block will disappear. So finally we obtain

	A	B	C	D	E	F	G	H	I
1	8 ^{✕²}	^{1 2} ₄	6	9 ^{1 5}	^{✕⁵} ₇	^{✕⁵} ₇	3		
2	9	6	3	4	7 ^{2 5}	1	^{2 5}	8	
3	5	7 ^{✕¹}	^{1 2}	3	8	6	9 ^{4 2}		
4	^{4 2 3}	8 ^{✕²}	5	1	7 ^{4 2 3}	6	9		
5	^{4 2 3}	1	5	9	8	6 ^{4 2 3}	^{4 2}	7	
6	6	9	7	3	2	4	8	1	5
7	^{✕²}	3	6	8	5	9 ^{4 2}	^{4 2}	1	
8	1 ^{4 2}	9	7	6	3	5	8 ^{✕²}		
9	7	5	8 ^{1 2}	4	^{1 2}	9	3	6	

The major problem with the coloring method is what techniques we are willing to apply to determine which elements should be one color and which should be the other. Do we allow pointing and claiming? Do we allow X-wings or even swordfish? The more techniques we use, the more this starts looking like trial and error. We use the word coloring when only very direct approaches are used and no special methods. When pointing and claiming are included we call it advanced coloring. We do not consider more methods.

The coloring technique is also messy to apply. You need some form of shadow administration because many times you try the coloring in vain. It then makes a horrible mess of your pencilmarks. Combined with that many difficult sudokus may involve several steps that need the coloring method we are not too wild about it and have decided to exclude the coloring method for at least part of the sudokus in the book. In the others we have made an attempt to limit the number of colorings.

For practical applications in our eyes the easiest method is to use a piece of stiff transparent plastic. Put this over the sudoku and then use colors on the plastic. If one uses washable ink, one can clean the plastic easily and use it again for the next attempt at coloring.

And now the sudoku for practicing coloring:

	A	B	C	D	E	F	G	H	I
1			4					2	
2		5	2			6			8
3	1						4		
4					4		9		7
5	9			3	6				
6	2	8				7			
7				2					
8					9	8		3	
9	8	3	5						

20 Contradictions

Coloring techniques are rather powerful, but as it turns out one can obtain nearly the same results in a simpler way. Let us have a look at the next diagram:

	A	B	C	D	E	F	G	H	I
1	6	3	8	₇ ⁵	9	1	4	₇ ⁵	2
2	1	₇ ⁵	₇ ⁵ ₉	4	6	2	₇ ³ ₉	8	₅ ³
3	2	4	₇ ⁵ ₉ ₇ ₈	3	₇ ₈	₇ ₉		1	6
4	9	6	₇ ⁵	3	1	₇ ₈ ⁴	₇ ₈	2	₄ ₈ ⁵
5	₄ ₈	₇ ⁵	3	9	2	6	1	₇ ⁵ ₄ ₈	
6	₄ ₈	2	1	₇ ₈	5	₄ ₇ ₈	6	3	9
7	3	9	4	1	8	5	2	6	7
8	5	1	6	2	7	9	₈ ³	4	₈ ³
9	7	8	2	6	4	3	5	9	1

There are a lot of cells in which there are only two possibilities. In this case many have the same two possibilities but that is unimportant for what we are studying here. Let us have a look at position 1D. Assume that this would have the value 5. We would get

	A	B	C	D	E	F	G	H	I
1	6	3	8	5	9	1	4	×	2
2	1	5	5	4	6	2	3	8	×
3	2	4	5	3	3	7	8	1	6
4	9	6	5	3	1	4	7	2	4
5	4	5	3	9	2	6	1	5	4
6	4	2	1	5	4	6	3	9	7
7	3	9	4	1	8	5	2	6	7
8	5	1	6	2	7	9	3	4	3
9	7	8	2	6	4	3	5	9	1

The red positions would all have to obtain the value 5 as a direct logical consequence. The only techniques we have used here are that they are everytime the only 5 left in a row, column or block. But as a consequence the 5's in 1H and 2I are vetoed and hence there cannot be a 5 in the third block (right top). This cannot be and hence in position 1D there cannot be a 5.

Here is another example:

	A	B	C	D	E	F	G	H	I
1	5	7	8	4	1	3	9	2	6
2	1	2	8	7	5	4	1	3	6
3	2	8	7	5	4	1	3	6	9
4	5	2	1	8	2	9	7	8	1
5	7	6	3	1	8	2	9	5	4
6	8	7	5	4	3	6	2	1	3
7	8	5	2	9	1	6	7	4	3
8	2	9	1	7	8	3	5	4	6
9	7	5	8	2	4	9	1	3	6

In the position 1E we try the 6. This eliminates the 6 in 1G and hence we get a 6 in 3I. This eliminates the 6's in 4I and 6I and hence 6G has to be a 6. This again eliminates the 6 in 6F and together with the fact that the original 1E eliminates the 6 in 4E the position 4D must be a 6. So together the 6's in 1E and 4D eliminate all 6's in block 8 (9E and 8D) and hence we have a contradiction. This is all relatively simple logic. We have taken the cases that there are two possible numbers in one block, row or column or in one cell as special. They are relatively easy. It becomes more complicated when a given number still has many possibilities as in

21 Some remarks

Some sudokus will allow shortcuts over the ‘official’ solution. The reason is that we cannot program everything and sometimes a combination of two methods will allow a much shorter road than given in the book. Let us have a look at an example. In one sudoku that was judged difficult enough to be in the book we encountered the following position:

	A	B	C	D	E	F	G	H	I
1	$\begin{smallmatrix} 2\ 3 \\ 6 \end{smallmatrix}$	8	7	9	4	$\begin{smallmatrix} 2\ 3 \\ 5 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	1	$\begin{smallmatrix} 2\ 3 \\ 5\ 6 \end{smallmatrix}$
2	$\begin{smallmatrix} 2\ 3 \\ 5 \\ 9 \end{smallmatrix}$	1	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	6	$\begin{smallmatrix} 2\ 3 \\ 9 \end{smallmatrix}$	7	4	$\begin{smallmatrix} 8\ 9 \\ 8\ 9 \end{smallmatrix}$	$\begin{smallmatrix} 2\ 3 \\ 8\ 9 \end{smallmatrix}$
3	$\begin{smallmatrix} 2\ 3 \\ 6 \\ 9 \end{smallmatrix}$	$\begin{smallmatrix} 3 \\ 9 \end{smallmatrix}$	4	8	5	1	7	$\begin{smallmatrix} 6 \\ 9 \end{smallmatrix}$	$\begin{smallmatrix} 2\ 3 \\ 6 \\ 9 \end{smallmatrix}$
4	4	6	3	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	7	9	8	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	1
5	$\begin{smallmatrix} 2 \\ 5 \\ 9 \end{smallmatrix}$	$\begin{smallmatrix} 5 \\ 9 \end{smallmatrix}$	1	3	8	4	6	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	7
6	8	7	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	1	6	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	9	3	4
7	7	$\begin{smallmatrix} 4\ 5 \\ 8 \end{smallmatrix}$	9	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	1	6	3	$\begin{smallmatrix} 4 \\ 8 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 5 \\ 8 \end{smallmatrix}$
8	1	$\begin{smallmatrix} 4\ \times \\ 3 \end{smallmatrix}$	8	7	$\begin{smallmatrix} 2\ 3 \\ 9 \end{smallmatrix}$	$\begin{smallmatrix} 2\ 3 \\ 5 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	$\begin{smallmatrix} 4\ 6 \\ 9 \end{smallmatrix}$	$\begin{smallmatrix} \times \\ \times \\ 6 \\ 9 \end{smallmatrix}$
9	$\begin{smallmatrix} 5 \\ 3 \end{smallmatrix}$	2	6	4	$\begin{smallmatrix} 3 \\ 9 \end{smallmatrix}$	8	1	7	$\begin{smallmatrix} 5 \\ 9 \end{smallmatrix}$

We see here the almost locked candidate technique involving the highlighted cells. The thing is that when we have two such cells they are bound to have the same values in the end. This is the opposite as with remote pairs where the cells alternate values. The ‘official solution’ continues now with a swordfish configuration, a finned swordfish, a jellyfish and much more as in

	A	B	C	D	E	F	G	H	I
1	$\begin{smallmatrix} 2\ 3 \\ 6 \end{smallmatrix}$	8	7	9	4	$\begin{smallmatrix} 2\ 3 \\ 5 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	1	$\begin{smallmatrix} 2\ 3 \\ 5\ 6 \end{smallmatrix}$
2	$\begin{smallmatrix} 2\ 3 \\ 5 \\ 9 \end{smallmatrix}$	1	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	6	$\begin{smallmatrix} 2\ 3 \\ 9 \end{smallmatrix}$	7	4	$\begin{smallmatrix} 8\ 9 \\ 8\ 9 \end{smallmatrix}$	$\begin{smallmatrix} 2\ 3 \\ 8\ 9 \end{smallmatrix}$
3	$\begin{smallmatrix} 2\ 3 \\ 6 \\ 9 \end{smallmatrix}$	$\begin{smallmatrix} 3 \\ 9 \end{smallmatrix}$	4	8	5	1	7	$\begin{smallmatrix} 6 \\ 9 \end{smallmatrix}$	$\begin{smallmatrix} 2\ 3 \\ 6 \\ 9 \end{smallmatrix}$
4	4	6	3	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	7	9	8	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	1
5	$\begin{smallmatrix} 2 \\ \times \\ 9 \end{smallmatrix}$	$\begin{smallmatrix} 5 \\ 9 \end{smallmatrix}$	1	3	8	4	6	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	7
6	8	7	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	1	6	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	9	3	4
7	7	$\begin{smallmatrix} 4\ 5 \\ 8 \end{smallmatrix}$	9	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	1	6	3	$\begin{smallmatrix} 4 \\ 8 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ \times \\ 8 \end{smallmatrix}$
8	1	$\begin{smallmatrix} 4 \\ 3 \end{smallmatrix}$	8	7	$\begin{smallmatrix} 2\ 3 \\ 9 \end{smallmatrix}$	$\begin{smallmatrix} 2\ 3 \\ 5 \end{smallmatrix}$	$\begin{smallmatrix} 2 \\ 5 \end{smallmatrix}$	$\begin{smallmatrix} 4\ 6 \\ 9 \end{smallmatrix}$	$\begin{smallmatrix} 6 \\ 9 \end{smallmatrix}$
9	$\begin{smallmatrix} 5 \\ 3 \end{smallmatrix}$	2	6	4	$\begin{smallmatrix} 3 \\ 9 \end{smallmatrix}$	8	1	7	$\begin{smallmatrix} 5 \\ 9 \end{smallmatrix}$

but if we are smart we notice now a link between the cells 6F and 1G:

	A	B	C	D	E	F	G	H	I
1	^{2 3} ₆	8	7	9	4	^{2 3}	² ₅	1	^{2 3} _{5 6}
2	^{2 3} _{5 9}	1	² ₅	6	^{2 3}	7	4	_{8 9}	^{2 3} _{8 9}
3	^{2 3} _{6 9}	₃	4	8	5	1	7	_{6 9}	^{2 3} _{6 9}
4	4	6	3	² ₅	7	9	8	² ₅	1
5	² _{5 9}	_{5 9}	1	3	8	4	6	² ₅	7
6	8	7	² ₅	1	6	² ₅	9	3	4
7	7	_{4 5}	9	² ₅	1	6	3	_{4 8}	² _{5 8}
8	1	_{4 3}	8	7	^{2 3} ₉	^{2 3} ₅	² ₅	_{4 6 9}	_{6 9}
9	³ ₅	2	6	4	_{3 9}	8	1	7	_{5 9}

When the cell 6F has the value 2, 4D is 5, 7D is 2, 8G is 2 and 1G is 5. When the cell 6F has the value 5, 4D is 2, 7D is 5, 8G is 5 and 1G is 2. The result is that either 6F or 1G is 2 and the 2 in 1F can be scratched. After that not much is needed to solve the entire sudoku. This kind of extra human smartness is beyond the power of the computer. Of course we could have programmed this specific combination of methods, but then there are others that one only becomes aware of when one sees them in an actual situation.

24 Solutions

It is traditional to publish solutions in the back of sudoku books. In the case of our sudokus however the more interesting thing is not the solution but how one obtains the solution. The fact that there is a unique solution means automatically that if you find a solution that contains the start numbers in their original position and if there are no rows, columns and blocks that contain the same number twice, it must be automatically the correct solution. We trust that anybody who has a good shot at the sudokus in this book, can determine whether his or her solution is proper. Hence not much is gained by showing the solution. Rather we show a mysterious string of characters that represents a path to the solution. There is no guarantee that this path is unique though. The reason is that we apply always the simplest method that will make progress. It may be possible that skipping a number of simple techniques and going to a more complicated technique solves the sudoku much faster. It would be rather complicated to investigate this systematically. Also, when the same method can be used in more than one way, there is an order in which we apply them which may be different from the order in which the reader applies them. But usually the bottlenecks are at a fixed location and knowing the encryption we used will reveal what is the critical step. One may wonder why we need this complicated encryption system, but that is a) a matter of space and b) a matter of not making it too easy for the reader to look up the answer and spoil the fun for that sudoku. The matter of space should be clear: a sufficiently complicated sudoku might need 10 pages or more to show all steps in the solution graphically. That means that with 2 sudokus per page we would need 20 times the space for the solutions. This would not leave much space for our sudokus.

Let us start simple and have a look at the sudoku that was used in the section on pencilmarks. The solution from the point where we started would be

a72 cCc d2r bIb8 h25 2H5 3D5 2D2 1G2 3A2 2C1 1A8 3F1 2F4 3H4 2I8 6B8 5A1 6H1
5H8 7B1 9B7 8C8 8G1 7H2 9C2 7C4 7I7 7G6 5I6 5G4 9I4 9G8

The simple moves that place a number in a cell are given by a coordinate followed by this number as in 2H5 which indicates that we place a 5 at position 2H. Similarly 9G8 means that we place 8 at position 9G. The interesting moves are the ones that start with an alphabetic character. This character indicates the method used and in each case the characters that follow have their own meaning. This is explained below:

- a** Pointing method. Followed by two digits. The first is the number of the block and the second the digit involved. Hence **a34** means pointing in block three (right top) involving number 4.
- b** Claiming method. If the third character is a c it concerns a column. In that case the second character is the letter of the column. If the third character is an r, it concerns a row and the second character is the number of the row. The fourth character is the number involved.
- c** A set of 2. The third character indicates r (row), c (column) or b (block). In the case of the c the second character is the letter of the column, otherwise it is number of either the row or the block.
- d** A set of 3. The third character indicates r (row), c (column) or b (block). In the case of the c the second character is the letter of the column, otherwise it is number of either the row or the block.

- e** An X-wings configuration. Followed either by two letters indicating two columns, the c of columns and the number involved, or by two digits for two rows, the r of rows and the number involved.
- f** A hidden set of 2. The third character indicates r (row), c (column) or b (block). In the case of the c the second character is the letter of the column, otherwise it is number of either the row or the block.
- g** A hidden set of 3. The third character indicates r (row), c (column) or b (block). In the case of the c the second character is the letter of the column, otherwise it is number of either the row or the block.
- h** Uniqueness type 1. Followed by 2 digits which are the possibilities in the main cells.
- i** Uniqueness type 1a. Followed by 2 digits which are the possibilities in the main cells.
- j** Uniqueness type 1b. Followed by 2 digits which are the possibilities in the main cells.
- k** Uniqueness type 2. Followed by 3 digits which are the possibilities in the main cells.
- l** Uniqueness type 2A. Followed by 2 digits which are the possibilities in the main cells.
- m** A set of 4. The third character indicates r (row), c (column) or b (block). In the case of the c the second character is the letter of the column, otherwise it is number of either the row or the block.
- n** A set of 5. The third character indicates r (row), c (column) or b (block). In the case of the c the second character is the letter of the column, otherwise it is number of either the row or the block.
- o** A swordfish configuration. Followed either by three letters indicating three columns, the c of columns and the number involved, or by three digits for three rows, the r of rows and the number involved.
- p** A finned X-wings configuration. Followed either by two letters indicating two columns, the c of columns and the number involved, or by two digits for two rows, the r of rows and the number involved.
- q** An XY-wings configuration. Followed by a digit and a letter indicating the coordinate of the center.
- r** Remote pairs. Followed by two digits which are the numbers in the pair.
- s** An XYZ-wings configuration. Followed by a digit and a letter indicating the coordinate of the center. An r or a c indicates whether the external cell is in the same row or the same column as the center cell.
- t** Almost locked candidates. The initial character is followed by two coordinates of the main and the second cells and a letter which indicates the mode: r for that the main cell is in a block and the second cell in a row, c for block + column, R for that the main cell is in a row and the second cell in a block and C for column + block.

- u** A finned swordfish configuration. Followed either by three letters indicating three columns, the c of columns and the number involved, or by three digits for three rows, the r of rows and the number involved.
- v** A jellyfish configuration. Followed either by four letters indicating four columns, the c of columns and the number involved, or by four digits for four rows, the r of rows and the number involved.
- w** A WXYZ-wings configuration. Followed by a digit and a letter indicating the coordinate of the center. After that is the extra number in the three wings.
- x** Coloring. Currently only followed by a digit which is the number involved in the coloring.

In principle this information is sufficient to find out which move you missed. Of course it is very well possible that you have the wrong pencilmarks in a cell and that this is the reason why you could not resolve the sudoku. There is very little we can do to help you there because that would require to give the graphical solutions to all nontrivial steps as we did in the section on pencilmarks. And this requires too much space again.

25 An example of a full solution

Here we present a sudoku and its solution, in which we have selected each time the simplest method that can eliminate one or more possibilities. Of course many times we can just assign a value to a cell. This will result in a single line in which this is mentioned. We have intentionally selected a complicated sudoku, just to show that such a solution takes very much space. In other words: we show here that it is impossible to present solutions to all sudokus in the book in a graphical way.

27 How were the sudokus made?

There is of course more than one method to make sudokus. Some concentrate on making pretty patterns with the given numbers. This seems to be quite a fashion. Of course, as soon as you have put some numbers all symmetry is lost anyway. We have created our sudokus in several different ways, some ignoring symmetry completely, some using some symmetry. The main thing we are interested in however is that with the methods that are allowed, the sudokus are as difficult as possible. This means that complexity is more important than symmetry.

All our methods start with generating a random final position. Because the method we use for this is relatively time consuming (we know faster ways but they give final positions that are very alike) we do this every 25 sudokus. We make them look different by applying some transformations to them like permuting the numbers, exchanging rows or columns within blocks, exchanging rows or columns of blocks etc. Because the difficult sudokus are rather rare (We generated 1 billion sudokus and took the 400 most difficult ones for this book), chances that even two of the sudokus use the same final position (if we do not look at the transformation that makes them look completely different anyway) are remote.

Next we make sure we have two subprograms ready: one to check whether a sudoku has more than one solution and one that can solve a sudoku if it needs only the methods we selected. The last subprogram is of course most work to construct. It is also important that these program segments are fast.

We construct the sudoku by taking out one number at a time, each time checking that the remaining configuration, when seen as a sudoku puzzle, has only one solution. We take these numbers at random. To do that, one needs a good pseudo random number generator. The pseudo refers to that we want to be able to reproduce these numbers in a different run, if

we choose so, because that allows us to catch errors in the program. But the random number generator should also allow for creating different sequences, so that we do not generate always the same sudokus. The book "The art of computer programming" by D. Knuth (vol. 2) gives several of such generators. One can also look in the internet.

If we take out a number and the puzzle it leaves has more than one solution we veto that position for future attempts and try randomly another number till no number that we take out gives a valid puzzle. Then we have a so-called minimal sudoku. If we are satisfied with the number of positions that is given (like no more than 30) we consider that we have generated a sudoku and now we decide to see whether it can be solved. As it turns out, the methods we use will solve about 75% of the sudokus that are generated this way. We just throw the remaining 25% away. Another thing that is noticed is that most of the sudokus generated this way are rather easy. They have the minimal difficulty and need none of the methods we mention. Not even pointing and/or claiming.

For generating the difficult sudokus we have in the book, we would have to generate about 5.5 billion sudokus. We want to do better with respect to difficult sudokus. This is not easy.

One way to try to improve the method is to see whether we can be more systematic about the final few steps, like trying all possibilities there. This requires more time per generated sudoku, but generated more non-trivial ones. Unfortunately we could not find any systematics in when a sudoku becomes difficult. It may well be that a sudoku is very easy till the last but one step and then when the last number is removed one has a super difficult one. The result was a bit disappointing as the yield of difficult sudokus per hour computer time was not higher than with the first method.

An improvement in generation speed is to build in some symmetry. Instead of taking out one number at a time we take two of which the positions are mirror images. This means that we have to check for unique solutions only half the time. The disadvantage is that we do not necessarily get a minimal sudoku, because in the end it may still be possible to take out some individual numbers in a non-symmetric way. The result is that although we generate twice as many sudokus per hour, there are fewer very difficult ones. Taking out 4 numbers at the same time to create even more symmetry unfortunately makes the program slower again. The failure rate is too high. We use this method only when we want to generate relatively easy sudokus, although those would still be classified as extreme in some collections.

What we try next is to use the symmetric method but then, in the end we try to take out individual numbers and see which one makes the sudoku more difficult. We take the number that makes it most difficult and then try again whether we can still take out another number that makes it even more difficult. This makes the program slower by a factor 4, but the yield per hour in very difficult sudokus increases considerably and is now almost three times higher than in the first program. This is the method we have actually used to generate the set of sudokus in the book.

One can try an other method of improvement by trying all combinations of numbers that can be removed in the final stage. In the method we described above the difficulty had to increase in each step. Now we take the maximum difficulty when all combinations of all steps in the final stage are considered. This does indeed give a higher percentage of difficult sudokus, but the extra time it takes is such that the yield per hour goes down. Hence we only used this method for study purposes.

For the (thusfar) most efficient method we have we had to make the observation that when one solves one of the generated sudokus, usually the first few moves are rather easy

and do not need any special methods. This means that after those moves the sudoku is still equally difficult. So we let the program make those first moves until it starts needing techniques and then start from that position taking out numbers again. If we have bad luck we end up with a sudoku that is equally difficult, but if we are lucky we obtain a more difficult sudoku. To ensure that we end up with difficult sudokus we start with the more difficult ones, like the ones that occur only once in 10000 generated sudokus. For those we try then a few hundred times. The result is rather spectacular. About 70% of the sudokus we submit to this procedure results in a more difficult one and our top category is expanded by a factor 30 or more while the computer time needed is increased only by a small percentage. In addition we obtain some sudokus that are even more difficult than what we generated before. We call this procedure difficulty boosting.

The final program was run on computers with an opteron processor which runs at 2.8 GHz. The 1 billion sudokus took 1860 hours of combined CPU time. As you may imagine, we did not print them all. For each degree of difficulty we collected in each of the 24 computers the first 1000 sudokus. It never found that many in the more difficult categories, so we did not lose very much doing this.

The examples were created with the unimproved program. Here we were interested in special sudokus that use, if possible, only one method but then as many times as possible. Those sudokus do not get a very high degree of difficulty in our counting, so the programs above would not select them easily.

Jos Vermaseren is a theoretical physicist at the Nikhef institute in Amsterdam. He has much experience playing games and making complicated computer programs. He is the author of the well known computer algebra program FORM, which is used worldwide for most difficult calculations in theoretical particle physics. He has also won the Humboldt prize for the calculations he has done with FORM.

His interest in sudokus started as purely recreational. But at a given moment he got involved in the programming of solution techniques in the language of FORM. This worked well and the program could solve nearly all sudokus in the collection of fiendish sudokus of the Times.

Eventually the problem of generating sudokus got his interest and the result is this book with hundreds of sudokus that are not for the fainthearted. The book will keep you busy for many hours.
