

Chiba - so far...

- A few sets of runs with a couple large
 - simple configuration
 - MaxOutstanding = 28
 - 1 RoI per event
 - 4096 bytes of data
 - 4 worker threads
 - TCP/IP data transfer

Rate vs.number of ROBs (SUP=8 Steer=8)

My many woes...

- Perl scripts working to handle customization of configurations
- Shell scripts okay to run configurations
 - need only list how many of each node and make changes to details in template configuration files
- Reference Software was working, but it appears to have broken (in attempt to fix unreliable execution - requiring retransmission of UDP commands and status requests)
 - Previous runs sometimes work - sometimes don't (no change in run conditions)!
